#### Abstract

WARNING This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

## CANADIAN D.O.C. WARNING

This digital apparatus does not exceed the Class A limits for radio noise emissions from digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Réglement sur le brouillage radioélectrique édicte par le ministère des Communications du Canada.

## Trademarks

Monarch®, Pathfinder®, Ultra®, and 6039 are trademarks of Avery Dennison Retail Information Services LLC.
Avery Dennison® is a trademark of Avery Dennison Corporation.
Microsoft, Windows, and NT are trademarks of Microsoft Corporation.

## GETTING STARTED

Before you read this manual, review the printer information in the Operator's Handbook.

## About This Manual

This manual is for the developer who is creating and designing custom formats for the Monarch® Pathfinder® Ultra® Platinum $6039{ }^{\text {TM }}$ printer. The printer operates on a Microsoft® Windows-based CE platform.

Note: You must develop an application that uses the packets you create. Refer to the Programmer's Manual for information about developing an application.

This chapter creates a sample Monarch® Printer Control Language II (MPCLII) packet.

## Standard Features

The following features are standard on the printer:

| Feature | $\mathbf{6 0 3 9}$ |
| :--- | :--- |
| DPI | 203 |
| Max. Print Image | $1.899^{\prime \prime} \times 3.65^{\prime \prime}$ |
| Print Speed | Up to 4" per second |
| LCD | Touch screen display |
| Number of Keys | 16 |
| Application Memory (Windows CE) | 32 MB RAM |
|  | 64 MB Flash |
| Printer Memory | 4 MB RAM |
|  | 4 MB Flash |
| Prints 2D Bar Codes | Yes |
| On-Demand Sensor | Yes |
| Supports International fonts | Yes |

A format defines which fields appear and where the fields are printed on the label. The printer requires this information in a special form. This section describes how to create a sample MPCLII format packet.

Make sure supplies are loaded, you have a fully charged battery, the printer is connected to a host and ready to receive data, and you have software in the printer. Refer to your Operator's Handbook for more information.

1. Type the following format header in any text editor:
$\{F, 25, A, R, E, 200,200, " F M T-25 "$ |
2. Type the following constant text field:

$$
\text { C, 140, 40, 0, 1, 2, 1,W, C, 0, 0, "SAMPLE FORMAT", } 1 \text { | }
$$

3. Type the following bar code field:

B, 1, 12, $F, 85,40,1,2,40,5, L, 0$ ।
4. Type the following text field:

$$
\mathrm{T}, 2,18, \mathrm{~V}, 50,50,1,1,1,1, \mathrm{~B}, \mathrm{~L}, 0,0,1 \mid\}
$$

For detailed information about the format header, text, constant text, and bar code fields, see Chapter 2, "Defining Fields." For information about batch packets, see Chapter 6, "Printing."

You have created a format packet for your MPCLII printer. Now, a batch packet must be created before you can print the format.
5. Type the following batch header, after the text field line:
$\{\mathrm{B}, 25, \mathrm{~N}, 1 \mid$
6. Type the following bar code data:

1,"02802811111" |
7. Type the following text field data:

2,"TEXT FIELD" | \}
8. Save your file as SAMPLE.FMT.

TEXT FIELD
9. For your application to use the format, use the Ultra.Net library functions in the Programmer Manual.

Here are some guidelines to follow when using MPCLII.

## MPCLII Punctuation

Use the following symbols when creating MPCLII packets:

| Character | Decimal <br> Value | Description |
| :--- | :--- | :--- |
| \{ (left bracket) | 123 | start of header |
| $\}$ (right bracket) | 125 | end of header |
| I (vertical bar) | 124 | field separator* |
| , (comma) | 044 | parameter separator |
| "ABC" <br> (quotation marks) | 034 | Quotation marks enclose character strings. Empty quotes ("") identify <br> null strings or unused fields. |
| 'comment' <br> (single quotation <br> marks) | 039 | Grave accents enclose comments. Any data enclosed in grave accents <br> is ignored. Do not embed comments within a quoted string. Grave <br> accents are also used to reject mainframe data. |

Note: These MPCL characters are the default.

* The field separator is the split vertical bar, which we are representing as |in this manual. The decimal value is 124. To enter this character, use the Shift key plus the Split Vertical Bar key on your computer's keyboard. Depending on your text editor, it may appear as a solid vertical bar or as a split vertical bar.

## Standard Syntax Guidelines

When creating MPCLII packets:

- Begin each packet with a start of header (\{).
- End each packet with an end of header (\}).
- Define no more than 200 fields in a format. Each | indicates one field. However, options are not counted as fields.
- The field number ( $0-999$ ) must be unique. We recommend starting at 1 , instead of 0 .
- Do not use a field number more than once per format.
- Define all fields in the order you want to image/print them.
- Separate all parameters with a Parameter Separator (,).
- End each field with a Field Separator (I).
- Enter all information in CAPITAL letters, except words or phrases within quotation marks.
- Include all parameters for a field unless documented as optional.
- Define non-printable text fields before the field to which they apply.
- Define options immediately after the field to which they apply.
- Multiple options can be used with most fields. Options can be used in any combination except as noted with each definition.
- Keep in mind that proportionally spaced fonts need wider fields than monospaced fonts. For variable field data, use a letter "W" to determine the maximum field size.
- Do not place a new line (return) or any other non-printing character within a field definition. However, a carriage return or line break after each | makes your formats easier to read.

```
T,1,20,V,30,30,1,1,1,1,B,C,0,0,0 ।
T,2,10,V,50,30,1,1,1,1,B,C,0,0,0 |
```

- Spaces are ignored, except within character strings.

## Starting with a Design

Before you create a format packet, you must design your label. To design a custom label:

1. Decide which fields should appear on your label. See "Determining Format Contents" for more information.
2. Determine your label size. Labels are available from us in a wide variety of sizes. Your application and the amount of data you need to print determines the supply size. Contact your sales representative for more information.
3. Draw a rough sketch of your label. You may want to draw several variations to see what works best. See "Drawing Rough Sketches" for more information.
4. Identify the field types that appear on your label. See "Considering Field Types" for more information.
5. Decide which fonts you want to use. See "Considering Fonts" for more information.
6. Fill out your Format Worksheet. See "Using the Format Worksheet" for more information.

At this point, you are ready to use your design.
7. Create a format packet, based on how you filled out your worksheet. See Chapter 2, "Defining Fields," for more information.
8. For your application to use the format, use the Ultra. Net library functions in the Programmer Manual.
9. Execute your application.

## Determining Format Contents

Before you lay out your format, you need to answer these questions. How large is your supply? Which fonts do you want to use? Do you want to include a bar code? Do you want to include graphics?

## Determining the Print Area

The print area varies, depending on the size of your supply. Below are the maximum and minimum print areas. Notice that the top edge of the supply exits the printer first. There is a non-print zone on the edges and top ( $0.235^{\prime \prime}$ ) and bottom ( 0.115 ") of the supply. For exact print area measurements of your supply, see the supply layout grids in Appendix D.

| Unit of Measure | Maximum <br> Supply Size | Maximum <br> Print Area | Minimum <br> Supply Size | Minimum <br> Print Area |
| :--- | :--- | :--- | :--- | :--- |
| English $(1 / 100$ ") | $205 \times 400$ | $189 \times 365$ | $120 \times 55$ | $109 \times 20$ |
| Metric $(1 / 10 \mathrm{~mm})$ | $521 \times 1016$ | $480 \times 927$ | $305 \times 140$ | $277 \times 51$ |
| Dots $(1 / 203$ dots $)$ | $416 \times 812$ | $384 \times 741$ | $244 \times 112$ | $221 \times 41$ |

The minimum supply length for peel mode is 0.785 inches with a printable area of 0.435 inches ( 11 mm or 88 dots). An image up to 11.65 inches ( 296 mm or 2365 dots) can be created by increasing the image buffer. See Chapter 5, "Configuring the Printer," for more information.

Use the following formulas to convert inches to dots and metric:

```
Dots = inches x 203
Metric (1/10mm) = inches x 254
English (1/100 inch) = 100 x (dots/203)
Dots = Metric (1/10 mm) x . }79
```

## Drawing Rough Sketches

After you decide what information you want to print, sketch how you want the information to appear on the label. Note any areas that are preprinted on the label, such as a logo.

As soon as you know what information to include on the label, and you have a rough sketch, you can use a supply layout grid to help you layout and size your label. If you do not want to use a grid, go to "Considering Field Types" to choose what information you want on your label.

## Using Supply Layout Grids

A supply layout grid contains measurement markers. These markers help you accurately position information on your label.

Decide whether you want to design formats using English, Metric, or Dot measurements. Choose from the following grids:

- English

The English grid is measured in 1/100 inches.

- Metric

The Metric grid is measured in $1 / 10$ millimeters (mm).

- Graphic

The printer uses dots to print images on a label. The printhead has 203 dots per inch (DPI).

If you want to use the supply layout grids, a copy of each is in Appendix D, "Format Design Tools."

## Considering Field Types

After you select a supply size, the next step in designing a format is to decide what information you want to print on the label. For example, you may want to print your company name, price of an item, and a bar code that combines information from other places. Everything you want to print falls into one of the following categories.

| Field Type | Description | Examples |
| :--- | :--- | :--- |
| Text | Contains letters, numbers, or symbols <br> you want to print. | item number, item description, <br> department number, price, date |
| Bar Code | Used for printing bar codes that can <br> be scanned. | item or serial numbers, zip codes, <br> information you don't want to have <br> visible to customers |
| Constant Text | Prints fixed characters that print <br> without changing. | company name, company address |
| Line or Box | Highlights or separates items. | line marking out the regular price, <br> border around the supply |
| Graphic | Contains a bitmap image or a <br> compliance label overlay. | logos |

Note: All of the above field types except graphics are discussed in Chapter 2. See Chapter 4, "Creating Graphics" for information on including graphics in your format.

## Considering Fonts

When working with fonts, you have three considerations:

- font appearance
- font size (bitmapped)
- font spacing (monospaced or proportional)

See Appendix B, "Fonts," for samples of each font.

## Using the Format Worksheet

The Format Worksheet is divided into sections that list the field types. Each section has boxes to fill in with parameters that define your format. A format worksheet is included in Appendix D, "Format Design Tools."

## Filling in the Format Worksheet

Decide what type of field to use on your label.

1. Make a copy of the Format Worksheet.
2. Define the Format Header.
3. Define options as you require them. See Chapter 3, "Defining Field Options" for more information.

## DEFINING FIELDS

This chapter provides a reference for defining

- the format header
- text and constant text
- bar code fields
- line and box fields.

## Defining the Format Header

A Format Header begins a format file.
Syntax
\{F,format\#, action, device,measure, length, width,"name" |

F1. F
F2. format\#
F3. action
F4. device

F5. measure

F6. length

F7. width
8. name"

Format name (optional), 0-8 characters, enclose within quotation marks.
Example $\{\mathrm{F}, 1, \mathrm{~A}, \mathrm{R}, \mathrm{E}, 300,100$, TEXTILES" |

Format 1 ("TEXTILES") uses a three inch long by one inch wide label.

Create a separate definition for each text field. If text falls on two lines, each line of text requires a separate definition.

Syntax

T1. $T$
T2. field\#

```
T,field#,# of char,fix/var,row,column, gap,font,hgt mag,wid
    mag,color,alignment, char rot,field rot,sym set |
```

T3. \# of char
T4. fix/var

T5. row

T6. column

Text Field.
Unique number from 0-999 to identify this field.
Maximum number of printed characters ( $0-2710$ ) in the field.
Fixed or variable length field. Options:
F Fixed length
V Variable length
For monospaced fonts, distance from bottom of print area to the pivot point. The pivot point varies depending on how text is justified.

For proportionally spaced fonts, distance from bottom of print area to baseline of characters in field.

| English | $0-365$ |
| :--- | :--- |
| Metric | $0-927$ |
| Dot | $0-741$ |

Note: If you reallocated memory for an 11.65-inch image, the row maximum is 1164 (English), 295 (metric), or 2364 (dots). The minimum printable length for peel mode is 0.435 inches ( 11 mm or 88 dots).

Distance from the left edge of the print area to the pivot point to find the column location.

| English | 0-189 |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

T7. gap Number of dots between characters (203 dots per inch). Range: 0-99.
Note: For monospaced fonts, the additional spacing is added to the existing inter-character gap. This is also true for proportionally spaced fonts, but remember that the inter-character gap varies with character combinations.

Any number other than $\mathbf{0}$ or the default number affects your field width. Default spacing:
Reduced and Letter Gothic Bold 6 pt. 1 dot
HR2 and Letter Gothic Bold 9 pt. 2 dots
Standard, Bold, OCRA-like, and HR1 3 dots
All other fonts varies with each letter
HR1 and HR2 are only used with the UPC bar code family and must be numeric.
T8. font Style of font. Options:

| $\mathbf{1}$ | Standard | $\mathbf{5}$ | HR1 |
| :--- | :--- | :---: | :--- |
| $\mathbf{2}$ | Reduced | $\mathbf{6}$ | HR2 |
| $\mathbf{3}$ | Bold | 10 | CG Triumvirate ${ }^{\text {TM }}$ Typeface Bold 9 pt |
| $\mathbf{4}$ | OCRA-like | $\mathbf{1 1}$ | CG Triumvirate ${ }^{\text {TM }}$ |
| Typeface 6 pt |  |  |  |

| CG Triur | mvirate | CG Triumvirate ${ }^{\text {TM }}$ |  |
| :---: | :---: | :---: | :---: |
| Typef | ce Bold | Typeface Bold Cond |  |
| 1000 | 6.5 pt | 1006 | 6.5 pt |
| 1001 | 8 pt | 1007 | 8 pt |
| 1002 | 10 pt | 1008 | 10 pt |
| 1003 | 12 pt | 1009 | 12 pt |
| 1004 | 18 pt | 1010 | 18 pt |
| 1005 | 22 pt | 1011 | 22 pt |
| Letter Gothic Bold |  |  |  |
| 1012 | 6 pt | 1013 | 9 pt | Or a valid downloaded font selector number. Make sure the downloaded font is installed in the printer. Fonts 5 and 6 are for numeric data only.

Point sizes greater than 12 include only the following special characters:
$0123456789 \# \$ \% \&(), . / @ D F K L M P S \backslash k p r o ̈ \not \subset £ \neq$. All other point sizes use the whole symbol set. This information may not apply to downloaded fonts.

T9. hgt mag Height magnifier, 1-7 (times- for bitmapped fonts). With TrueType/Scalable fonts, use 4-250, for the font's point size.

T10. wid mag Width magnifier, 1-7 (times). With TrueType/Scalable fonts, use 4-250, for the font's point size. Proportionally spaced fonts do not have a set width. To estimate the size of your field, use the letter "W" for the widest field or an " $L$ " for an average width field. Find your selected font and the desired width in Appendix B, "Fonts."

T11. color
Options for standard printer fonts:
B Opaque, Normal, Black, Normal
D/R/W Opaque, Normal, White, Normal
0
Transparent, Normal, Black, Normal
Options for scalable fonts:

| A/N | Opaque, Normal, Black, Bold |
| :--- | :--- |
| B/O | Opaque, Normal, Black, Normal |
| E/S | Opaque, Italics, Black, Bold |
| F/T | Opaque, Italics, Black, Normal |

| COATS | Line field | COATS |
| :---: | :---: | :---: |
| $\begin{gathered} \text { サRS }-79.99- \\ \text { F } 60.00 \end{gathered}$ | blocked out by opaque field using attribute $B$ |  |

Line field not blocked out by transparent field using attribute 0

Note: Solid black print should not exceed $30 \%$ on a given square inch of the label, or the printhead life may be decreased.

There are two types of field color overlay attributes:
Transparent The overlay field (text or constant text) does not block out (or "erase") existing fields.
Opaque The overlay field blocks out (or "erases") existing fields.
Field placement in the packet is an important consideration when using field color attributes. If a line field is defined before the overlay (text or constant text) field, the line field is blocked out by the overlay field, depending on the overlay field's color attribute. If a line field is defined after the overlay field, the line field is not blocked out by the overlay field, regardless of the overlay field's color attribute.

T12. alignment
Alignment of text in the field. Options:
L Align on left side of field.
C Center text within field (monospaced fonts only)
R Align on right side of field (monospaced fonts only)
B Align at midpoint of field
E Align at endpoint of the field
Use L, B, or E for any font.
T13. char rot

T14. field rot
0 Top of character points to top of field
1 Top of character points to left of field
2 Top of character points to bottom of field
3 Top of character points to right of field

Character rotation. The field or supply does not rotate, only the characters do. Options:

Field rotation. Field rotation rotates the whole field, not just the characters. Rotation is affected by the pivot point, which varies depending on how text is justified. Lower left corner of field is the pivot point. Options:

0 Top of field points to top of supply
1 Top of field points to left of supply
2 Top of field points to bottom of supply
3 Top of field points to right of supply

| MONARCH | MONARCH | MONARCH | MONARCH |
| :---: | :---: | :---: | :---: |
| Field | $\frac{\square}{\frac{0}{0}}$ | Ple! | $\frac{T!}{\frac{T}{2}}$ |

T15. sym set Symbol set. Use 0 for the Internal Symbol Set. For scalable or TrueType ${ }^{\circledR}$ fonts, use:

| $\mathbf{1}$ | ANSI Symbol Set |
| :--- | :--- |
| $\mathbf{1 0 0}$ | Macintosh |
| $\mathbf{1 0 1}$ | Wingdings |
| $\mathbf{1 0 2}$ | Unicode (user input) for particular mapping |
| $\mathbf{1 0 3}$ | BIG5 (user input) for Unicode mapping |
| $\mathbf{1 0 4}$ | GB2312 (user input) for Unicode mapping |
| $\mathbf{1 0 5}$ | SJIS (user input) for Unicode mapping - Code Page 932 (Japanese Shift-JIS) |
| $\mathbf{1 0 6}$ | GB2312 (user input) for GB2312 mapping - Code Page 936 (Simplified Chinese) |
| $\mathbf{1 0 7}$ | BIG5 (user input) for BIG5 mapping - Code Page 950 (Traditional Chinese) |
| $\mathbf{4 3 7}$ | DOS Code Page 437 (Domestic) |
| $\mathbf{8 5 0}$ | DOS Code Page 850 (International) |
| $\mathbf{8 5 2}$ | DOS Code Page 852 (Latin 2) |
| $\mathbf{8 5 5}$ | DOS Code Page 855 (Russian) |
| $\mathbf{8 5 7}$ | DOS Code Page 857 (IBM Turkish) |
| $\mathbf{8 6 0}$ | DOS Code Page 860 (MS-DOS Portuguese) |
| $\mathbf{1 2 5 0}$ | Code Page 1250 (Latin 2) |
| $\mathbf{1 2 5 1}$ | Code Page 1251 (Cyrillic) |
| $\mathbf{1 2 5 2}$ | Code Page 1252 (Latin 1) |
| $\mathbf{1 2 5 3}$ | Code Page 1253 (Greek) |
| $\mathbf{1 2 5 4}$ | Code Page 1254 (Turkish) |
| $\mathbf{1 2 5 5}$ | Code Page 1255 (Hebrew) |
| $\mathbf{1 2 5 6}$ | Code Page 1256 (Arabic) |
| $\mathbf{1 2 5 7}$ | Code Page 1257 (Baltic) |
| $\mathbf{1 2 5 8}$ | Code Page 1258 (Vietnam) |

The Standard, Reduced, Bold, OCRA and HR fonts only support the Internal Symbol Set (0). The CG Triumvirate ${ }^{\text {TM }}$ typefaces support only the ANSI and DOS Code Page 437 and 850 Symbol Sets. The scalable font (font\#50) does not support Code Page 1256 (Arabic). Code pages 852-860 and 1250-1258 are for downloaded TrueType fonts or the scalable font. Code pages 102-107 require the print engine memory expansion option and a downloaded International TrueType font. TrueType fonts are designed to be regionally specific; therefore, all code pages may not be supported in a given font. See Appendix C, "Symbol Sets/ Code Pages" for more information.

## Example $\mathrm{T}, 2,10, \mathrm{~V}, 250,80,0,1,1,1, \mathrm{~B}, \mathrm{C}, 0,0,0$ ।

Defines a text field (field \#2) with a variable length of up to 10 characters. The field begins at row 250 , column 80 . There is no additional gap between characters, and the Standard font is used without any additional magnification. The printing is black on white and centered. No field or character rotation is used. The internal symbol set is used.

## Each bar code field requires a separate definition.

Syntax

B1. B
B2. field\#
B3. \# of char

B,field\#,\# of char,fix/var,row, column,font, density,height,text, alignment,field rot,type,sep_height, segment |

Bar Code Field.
Unique number from 0-999 to identify this field.
Maximum number of characters. If the bar code uses a check digit, allow an extra character for the check digit. The actual maximum number of characters is limited by the size of the label and bar code density. Range: 0-2710.

For Quick Response bar codes, this number includes header information. The maximum depends on the type of characters entered for the batch data and differs for the two models of the bar code.

| Data Type | Model 1 | Model 2 |
| :--- | :--- | :--- |
| Numeric Data | 1167 | 2710 |
| Alphanumeric data | 707 | 2710 |
| 8-byte data | 486 | 2710 |
| Kanji data | 299 | 1817 |

Note: The maximum number of characters depends on the selected level of error correction. As you increase the error correction level, the maximum number of characters decreases.

For the GS1 DataBar ${ }^{\text {TM }}$ bar code, the maximum number of characters varies based on the specific GS1 DataBar type.

| Bar Code Type (B13) | Maximum Number of Characters |
| :---: | :---: |
| 1-GS1 DataBar 14 | 13 - no check digit input |
| 2-GS1 DataBar 14 Truncated | 13 - no check digit input |
| 3-GS1 DataBar 14 Stacked | 13 - no check digit input |
| 4-GS1 DataBar 14 Stacked Omni directional | 13 - no check digit input |
| 5-GS1 DataBar Limited | 13 - no check digit input |
| 6-GS1 DataBar Expanded | * |
| 7 - UPCA | 11 - no check digit input |
| 8 - UPCE | 10 - no check digit input |
| 9 - EAN13 | 12 - no check digit input |
| 10 - EAN8 | 7 - no check digit input |
| 11 - UCC/EAN128 and CC A/B | * |
| 12-UCC/EAN128 and CC C | * |

Note: If not enough characters are entered, the bar code pads to the left with zeros. If too many characters are entered, unpredictable results may occur.
If FNC1 (function 1) is supported, use the pound sign (\#) in the batch data to invoke it.

Fixed (F) or variable (V) length field.

| Bar Code | Number of Characters | Fixed or Variable |
| :---: | :---: | :---: |
| UPCA | 12 | F |
| UPCA+2 | 14 | F |
| UPCA+5 | 17 | F |
| UPCA+Price CD | 12 | F |
| UPCE | 7 | F |
| UPCE+2 | 9 | F |
| UPCE+5 | 12 | F |
| EAN8 | 8 | F |
| EAN8+2 | 10 | F |
| EAN8+5 | 13 | F |
| EAN13 | 13 | F |
| EAN13+2 | 15 | F |
| EAN13+5 | 18 | F |
| EAN13+Price CD | 13 | F |
| POSTNET | 9 or 11 | F |
| Interleaved 2 of 5 or Interleaved I 2 of 5 with Barrier Bar | 0-2710 | F or V |
| Code 39 (w/ or w/o CD) or MOD43 | 0-2710 | F or V |
| Codabar | 0-2710 | F or V |
| Code 16K | 0-2710 | V |
| Code 128 | 0-2710 | F or V |
| Code 93 | 0-2710 | V |
| MSI | 0-14 | F or V |
| PDF 417 | 0-2710 | F or V |
| Maxicode* | 15-99 | F or V |
| Data Matrix* | 0 to 2335 (alphanumeric) 0 to 2710 (numeric) | V |
| Quick Response* | 1167-2710 (numeric) 707-2710 (alphanumeric) | V |
| GS1 DataBar* | 0-13 | V |

* For more information about MaxiCode, Data Matrix, Quick Response, and GS1Data Bar, see Appendix A, "Samples." To print certain bar codes, you need the following versions of software:

| Bar Code | Version* |
| :---: | :---: |
| QR Code | 2.0 or greater |
| Data Matrix | 2.8 or greater |
| GS1 DataBar | 3.0 or greater |

* Printers with version 1.x software cannot be upgraded. Contact Service for more information.

15 EAN8 +5

| English | $0-189$ |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

Distance from bottom of the print area to the pivot point of the field. The pivot point varies, depending on how the field is justified. Pivot points:

Remember to include text or numbers that may appear with the bar code for the row measurement.

| English | $0-365$ |
| :--- | :--- |
| Metric | $0-927$ |
| Dot | $0-741$ |

Distance from the lower left edge of the print area to the pivot point.

Note: Allow a minimum of $1 / 10$ inch between the scan edge of bar code and label edges or other data.

B8. density Bar code density. Use the following table for other bar codes.
Note: If the field contains an 11-digit UPC bar code, the printer automatically zero-suppresses it into a 6-digit UPCE bar code.

| Bar Code Type | Density <br> Selector | Density (\% or cpi) | Narrow Element (dots/mils) | Narrow to Wide Ratio | Data Length | Appearance Codes Available | Char Set |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { UPCA +2/+5 } \\ & \text { Price CD } \end{aligned}$ | $\begin{array}{\|l} 2 \\ 4 \end{array}$ | $\begin{aligned} & 76 \% \\ & 114 \% \end{aligned}$ | $\begin{array}{\|l\|} \hline 2 / 9.9 \\ 3 / 14.8 \end{array}$ | N/A | $\begin{aligned} & 11 \text { or } 12 \\ & 14 / 17 \end{aligned}$ | 1,5,6,7 or 8 | 0 to 9 |
| $\begin{aligned} & \text { UPCE } \\ & +2 /+5 \end{aligned}$ | $\begin{aligned} & 2 \\ & 4 \end{aligned}$ | $\begin{aligned} & 76 \% \\ & 114 \% \end{aligned}$ | $\begin{array}{\|l} 2 / 9.9 \\ 3 / 14.8 \end{array}$ | N/A | $\begin{aligned} & 6 \text { or } 7 \\ & 9 / 12 \end{aligned}$ | $1,5,6,7$ or 8 | 0 to 9 |
| $\begin{aligned} & \text { EAN8 } \\ & +2 /+5 \end{aligned}$ | $\begin{array}{\|l} 2 \\ 4 \end{array}$ | $\begin{aligned} & 76 \% \\ & 114 \% \end{aligned}$ | $\begin{array}{\|l} 2 / 9.9 \\ 3 / 14.8 \end{array}$ | N/A | $\begin{aligned} & 7 \text { or } 8 \\ & 10 / 13 \end{aligned}$ | $1,5,6,7$ or 8 | 0 to 9 |

| Bar Code | $\begin{gathered} \text { Size } \\ \text { Row } \times \text { Col. } \end{gathered}$ | Density Selector | Max. Data Length Num. X Alphanum. | App Code | Char Set |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Data Matrix Rectangular symbols | $\begin{aligned} & 8 \times 18 \\ & 8 \times 32 \\ & 12 \times 26 \\ & 12 \times 36 \\ & 16 \times 36 \\ & 16 \times 48 \end{aligned}$ | $\begin{array}{\|l\|} \hline 25 \\ 26 \\ 27 \\ 28 \\ 29 \\ 30 \\ 0 \text { default (bar } \end{array}$ | $\begin{array}{\|l} \hline 10 \times 6 \\ 20 \times 13 \\ 32 \times 22 \\ 44 \times 31 \\ 64 \times 46 \\ 98 \times 72 \end{array}$ <br> de size automatically | 8 <br> determined | OOH to FFH |

Note: The printers support printing a Data Matrix symbol with an X-dimension of 13 mils or greater. If you use a denser bar code, make sure the bar code scans in your particular application. Our "premium" supplies and increasing the print contrast are recommended for denser bar codes. Depending on your application, additional densities are available.

B9. height Bar code height, in $1 / 100$ inches, $1 / 10 \mathrm{~mm}$, or dots. Minimum values:

| English | 20 |
| :--- | :--- |
| Metric | $\mathbf{5 1}$ |
| Dots | $\mathbf{4 1}$ |

POSTNET, PDF417, and MaxiCode bar codes have a fixed height. Always use $\mathbf{0}$ for these bar codes.
Small Data Matrix and QR Codes may not be scannable. The Data Matrix and QR Code's height depends on the number entered for this parameter. For example, if you select 80 , the symbol could be smaller than $0.80, "$ but it will not be greater than the amount specified in this parameter. The symbol arranges the data according to rows and columns within the specified height. For the GS1 DataBar bar code, use the height only for UCC/EAN family types listed in B13. For Quick Response bar codes, the value you enter is the symbol's maximum height. Small bar codes may not be scannable.

0 Default

## MaxiCode Mode 0 (obsolete)

QR Code Model 2
1 No check digit or number system
QR Code Model 1
2 MaxiCode Mode 2 (Numeric Postal Code)
QR Code Model 2
3 MaxiCode Mode 3 (Alphanumeric Postal Code)
5 Number system at bottom, no check digit
6 Check digit at bottom, no number system
7 Check digit and number system at bottom
8 No text, bar code only
MaxiCode (autodetect modes 0, 2, or 3)
Data Matrix
B11. alignment Choose L, R, C, B or $\mathbf{E}$ to align the bar code data correctly in the field. B centers variable width bar codes, which may not allow pad-character centering (Code 128, Code 39, etc.) E right justifies variable width bar codes. MaxiCode, Data Matrix, QR Code, and GS1 DataBar must use L.

B12. field rot Field rotation. Field rotation rotates the whole field, not just the characters. Rotation is affected by the pivot point, which varies depending on how text is justified. Lower left corner of field is the pivot point. Options:

0 Top of field points to top of supply
1 Top of field points to left of supply
2 Top of field points to bottom of supply
3 Top of field points to right of supply
Note: Serial bar codes printed at speeds greater than 1.5 IPS may not scan properly.
B13. type Select from the bar code family. This parameter only applies to the GS1 DataBar bar code. For other bar codes, do not include this parameter. Options:

| $\mathbf{1}$ | GS1 DataBar 14 (default) |
| :--- | :--- |
| $\mathbf{2}$ | GS1 DataBar 14 Truncated |
| $\mathbf{3}$ | GS1 DataBar 14 Stacked |
| $\mathbf{4}$ | GS1 DataBar 14 Stacked Omni directional |
| $\mathbf{5}$ | GS1 DataBar Limited |
| $\mathbf{6}$ | GS1 DataBar Expanded |
| $\mathbf{7}$ | UPCA |
| $\mathbf{8}$ | UPCE |
| $\mathbf{9}$ | EAN13 |
| $\mathbf{1 0}$ | EAN8 |
| $\mathbf{1 1}$ | UCC/EAN128 and CC A/B |
| $\mathbf{1 2}$ | UCC/EAN128 and CC C |

B14. sep_height Height of the separator between the linear bar code and 2D bar code. The value is 1 or 2. The default is 1 . This parameter only applies to the GS1 DataBar bar code. For other bar codes, do not include this parameter.

B15. segment
Width of the segment - only for use with GS1 DataBar family types listed in B13. The range is even numbers from 2 to 22. The default is 22 . For other bar codes, do not include this parameter.

Example $\quad \mathrm{B}, 3,12, \mathrm{~V}, 50,40,1,2,80,7, \mathrm{~L}, 0$ ।
Defines a bar code field (field \#3) with 12 characters of variable length starting at row 150 , column 40. A UPCA bar code with a density of 2 and a height of 80 is used. The check digit and number system are shown at the bottom. The bar code is left aligned without any field rotation.

Example $\quad \mathrm{B}, 1,30, \mathrm{~V}, 5,5,38,4,0,0, \mathrm{~L}, 0,1,2,22$ ।
Defines a bar code field (field \#3) with up to 30 characters of variable length starting at row 5 , column 5. The GS1 DataBar uses a density of 4 . No text is shown with the bar code. The bar code is left-aligned with no field rotation.

## Defining Constant Text Fields

A constant text field is a set of fixed characters that prints on all labels. Define each constant text field separately. This field is not assigned a field number, but is counted as a field (keep this in mind, as the printer allows a maximum of 200 fields per format). The characters in this field cannot be changed by batch data. Field options do not apply to constant text fields.

Determine the height and the maximum width of the characters, using the tables in Appendix B, "Fonts." If you're using proportionally spaced fonts, use the average size of the characters. Mark the pivot point of your field. This varies depending on how your field is justified.

C8. color Options for standard printer fonts:

| B | Opaque, Normal, Black, Normal |
| :--- | :--- |
| D/R/W | Opaque, Normal, White, Normal |
| O | Transparent, Normal, Black, Normal |

Options for scalable fonts:
A/N Opaque, Normal, Black, Bold
B/O Opaque, Normal, Black, Normal
E/S Opaque, Italics, Black, Bold
F/T Opaque, Italics, Black, Normal
Note: Solid black print should not exceed $30 \%$ on a given square inch of the label, or the printhead life may be decreased.

There are two types of field color overlay attributes:
Transparent The overlay field (text or constant text) does not block out (or "erase") existing fields.
Opaque The overlay field blocks out (or "erases") existing fields.
Field placement in the packet is an important consideration when using field color attributes. If a line field is defined before the overlay (text or constant text) field, the line field is blocked out by the overlay field, depending on the overlay field's color attribute. If a line field is defined after the overlay field, the line field is not blocked out by the overlay field, regardless of the overlay field's color attribute.

C9. alignment Alignment of constant text in the field. Options:
L Align on left side of field.
C Center text within field (for monospaced fonts only)
$\mathbf{R}$ Align on right side of field (for monospaced fonts only)
B Align at midpoint of field
E Align at end of field.
Use L, B, or E for any font.
C10. char rot Character rotation. Options:
0 Top of character points to top of field
1 Top of character points to left of field
2 Top of character points to bottom of field
3 Top of character points to right of field

C11. field rot Field rotation. Lower left corner of field is the pivot point. Options:
0 Top of overlay points to top of supply
1 Top of overlay points to left of supply
2 Top of overlay points to bottom of supply
3 Top of overlay points to right of supply
Note: Rotation is affected by the pivot point, which varies depending on how text is justified.

C12. "fixed char" Fixed characters to appear in the field. Maximum 2710 characters. Enclose in quotation marks.
C13. sym set Symbol set. Use $\mathbf{0}$ for the Internal Symbol Set. For scalable or TrueType® fonts, use:

| $\mathbf{1}$ | ANSI Symbol Set |
| :--- | :--- |
| $\mathbf{1 0 0}$ | Macintosh |
| $\mathbf{1 0 1}$ | Wingdings |
| $\mathbf{1 0 2}$ | Unicode (user input) for particular mapping |
| $\mathbf{1 0 3}$ | BIG5 (user input) for Unicode mapping |
| $\mathbf{1 0 4}$ | GB2312 (user input) for Unicode mapping |
| $\mathbf{1 0 5}$ | SJIS (user input) for Unicode mapping - Code Page 932 (Japanese Shift-JIS) |
| $\mathbf{1 0 6}$ | GB2312 (user input) for GB2312 mapping - Code Page 936 (Simplified Chinese) |
| $\mathbf{1 0 7}$ | BIG5 (user input) for BIG5 mapping - Code Page 950 (Traditional Chinese) |
| $\mathbf{4 3 7}$ | DOS Code Page 437 (Domestic) |
| $\mathbf{8 5 0}$ | DOS Code Page 850 (International) |
| $\mathbf{8 5 2}$ | DOS Code Page 852 (Latin 2) |
| $\mathbf{8 5 5}$ | DOS Code Page 855 (Russian) |
| $\mathbf{8 5 7}$ | DOS Code Page 857 (IBM Turkish) |
| $\mathbf{8 6 0}$ | DOS Code Page 860 (MS-DOS Portuguese) |
| $\mathbf{1 2 5 0}$ | Code Page 1250 (Latin 2) |
| $\mathbf{1 2 5 1}$ | Code Page 1251 (Cyrillic) |
| $\mathbf{1 2 5 2}$ | Code Page 1252 (Latin 1) |
| $\mathbf{1 2 5 3}$ | Code Page 1253 (Greek) |
| $\mathbf{1 2 5 4}$ | Code Page 1254 (Turkish) |
| $\mathbf{1 2 5 5}$ | Code Page 1255 (Hebrew) |
| $\mathbf{1 2 5 6}$ | Code Page 1256 (Arabic) |
| $\mathbf{1 2 5 7}$ | Code Page 1257 (Baltic) |
| $\mathbf{1 2 5 8}$ | Code Page 1258 (Vietnam) |

The Standard, Reduced, Bold, OCRA and HR fonts only support the Internal Symbol Set (0). The CG Triumvirate ${ }^{\text {TM }}$ typefaces support only the ANSI and DOS Code Page 437 and 850 Symbol Sets. The scalable font (font\#50) does not support Code Page 1256 (Arabic). Code pages 852-860 and 1250-1258 are for downloaded TrueType fonts or the scalable font. Code pages 102-107 require the print engine memory expansion option and a downloaded International TrueType font. TrueType fonts are designed to be regionally specific; therefore, all code pages may not be supported in a given font. See Appendix C, "Symbol Sets/ Code Pages" for more information.

## Example $\quad \mathrm{C}, 100,80,0,1,1,1, B, L, 0,0, " M A D E$ IN USA",0 ।

Defines a constant text field starting at row 100, column 80. It does not have any additional inter-character gap. The Standard font is used without any additional magnification. The printing is black on white and left justified. No field or character rotation is used. "MADE IN USA" is printed in this field. The internal symbol set is used.

## Defining Line Fields

Use lines to form borders and mark out original prices. Define each line separately. This field is not assigned a field number, but is counted as a field (keep this in mind, as the printer allows a maximum of 200 fields per format). You can define any line length and a thickness up to 99 dots, as long as the solid black print does not exceed 30 percent of any given square inch of the label.

## Line Types

You can create horizontal and vertical lines. There are two ways to define lines.

L1. L

L2. type

L3. row

L4. column

L5. angle lend row

Segments
Vectors You choose the starting point, the angle, and the length of the line.
You choose the starting point and ending point.

Syntax L,type,row, column, angle/end row,length/end col,thickness, "pattern" |

Line Field.
Type of line. Only vertical and horizontal lines are supported. Options:
S Segment. You choose the starting point and ending point.
V Vector. You choose the starting point, angle, and length.
Distance from bottom of print area to the starting point.

| English | $0-365$ |
| :--- | :--- |
| Metric | $0-927$ |
| Dot | $0-741$ |

Distance from left edge of the print area to line origin.

| English | $0-189$ |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

If Using Segments:

Row location of ending point. Measure from bottom of print area. Ranges same as row above. On horizontal lines, this value must match item L3.

If Using Vectors:
Angle of line. Options: 0, 90, 180, or 270.

L6. length/ end col

If Using Segments:

Column location of end point. Measure from left edge of print area. Ranges same as column above. On vertical lines, this value must match parameter L4.

If Using Vectors:
Length of the line in selected units.
Ranges for horizontal lines:

| English | $0-189$ |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

Ranges for vertical lines:
English 0-365
Metric 0-927
Dot 0-741
L7. thickness
Using the chart below for reference, write the line thickness
(1-99) in box L7. Measured in dots.

| Dots | Thickness |
| :---: | :---: |
| 1 |  |
| 10 |  |
| 24 |  |
| 48 |  |
|  |  |
| 96 |  |

Note: Line thickness fills upward on horizontal lines, or to the right on vertical lines.
L8. "pattern" Line pattern. Enter"".
Example
L, S, 110, 70, 110, 350, 10, "" |

Defines a horizontal line field as a segment starting at row 110, column 70 and ending at row 110 , column 350 . The line thickness is 10 dots.

Use boxes to form borders or highlight items of interest. Define each box field separately. This field is not assigned a field number, but is counted as a field (keep this in mind, as the printer allows a maximum of 200 fields per format). You can define any line length and a thickness up to 99 dots, as long as the solid black print does not exceed 30 percent of any given square inch of the label.

Syntax
Q, row, column, end row, end col,thickness, "pattern" ।
Q1. Q
Q2. row

Q3. column

Q4. end row
Distance from bottom of print area to upper right corner of box. Ranges same as row.

Q5. end col Distance from left edge of print area to upper right corner of box. Ranges same as column.

Distance from left edge of print area to lower left corner of box.

| English | $0-189$ |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

 dots.

| Dots | Thickness |
| :---: | :---: |
| 1 |  |
| 10 |  |
| 24 |  |
| 48 |  |
|  |  |
| 96 |  |

Note: Line thickness fills upward on horizontal lines, or to the right on vertical lines.

## Q7. "pattern"

Line pattern. Enter "".

## Example

Q, 240, 80, 270, 130, 3,"" |

Defines a box field starting at row 240 , column 80 . It ends at row 270 , column 130. It has a thickness of 3 dots.

## DEFINING FIELD OPTIONS

3
This chapter provides a reference for defining

- field options in formats
- check digit packets.

## Applying Field Options

Field options further define text and bar code fields. The text, constant text, or bar code field must be previously defined before you can apply any field option to it. Define options immediately after the field to which they apply.

## Combining Field Options

You can use more than one option with most fields. When you use multiple options for the same field, you must place the options in the order you want to apply them to your format.

## Restrictions

Some options cannot be used together. See the following sections addressing individual options for specific combinations to avoid.

| Example | $\mathrm{R}, 1,3,1,3,1,1 \quad$ |
| :--- | :--- |
| Syntax | R, option\#, parameter...parameter |
| R1. R | Indicates field option header. |
| R2. option\# | Option number: |
|  | $\mathbf{1}$ Define Fixed Characters |
|  | $\mathbf{4}$ Copy Data |
|  | $\mathbf{3 0}$ Pad Characters |
|  | $\mathbf{3 1}$ Calculate Check Digit |
|  | $\mathbf{4 2}$ Format as a Price Field |
|  | $\mathbf{5 0}$ Define Bar Code Densities |
|  | $\mathbf{5 1}$ Define Security and Truncation of PDF417 Bar Codes |
|  | $\mathbf{5 2}$ Define Width or Length of PDF417 Bar Codes |
|  | $\mathbf{6 0}$ Define Incrementing/Decrementing Fields |
|  | $\mathbf{6 1}$ Re-Image Fields |

R3. parameter(s) Varies per option. See the following option descriptions.

## Option 1 (Fixed Data)

Fixed data is information (a company name or store number) you want to print on all labels. You can define fixed characters for an entire field or for part of a field.

Syntax
R,1,"fixed char" |

R1. $R \quad$ Option Header.
R2. 1 Option 1.
R3. fixed char Characters to insert. Enclose in quotation marks. If you are defining fixed characters for part of a field, place underscores(_) in non-fixed positions. Any spaces in the phrase are fixed characters. Range: 0-2710.

Note: Underscore characters are stripped out and the data is compressed if no data is supplied by the batch and the field length is variable.

Example

Uses fixed characters (\% \$) in positions 4 and 5. The other positions are variable.
Example R,1,"MONARCH" |
"MONARCH" appears as a fixed field in this example.
To fill in the non-fixed portion of the field, see "Defining Batch Data Fields" in Chapter 6. As an alternative, you can apply Option 4 to copy data into the non-fixed character positions.

You can create a field that uses data from another field. This is useful for creating merged fields or sub-fields. You can copy the information from multiple fields into one field by applying the copy procedure more than once. Copy data is the only option you can apply to a field more than once.

The maximum number of characters defined in box T3 or B3 must allow for the number of characters you will place in the field, including any price, check digit, or fixed characters inserted by the printer. The maximum number of characters in the field into which data is copied cannot exceed 2710 or the maximum number of characters permitted by the bar code.

Note: When copying from more than one field, copy into the destination field from left to right.

| Syntax | R,4,src fld,src start,\# to copy,dest start, copy code |
| :---: | :---: |
| R1. R | Field Option Header. |
| R2. 4 | Option 4. |
| R3. src fld | Field number from which data is copied. Range: 0-999. |
| R4. src start | Position number in the source field of the first character to be copied. Character positions are numbered 1-2710, starting from the left. |
| R5. \# to copy | Number of characters to copy. Range: 1-2710. |
| R6. dest start | Position number where copied characters are to begin printing in the destination field. Range: 1 2710. |
| R7. copy code | Copy Method. |
|  | 1 Copy field as is (including price symbols, pad characters, check digits, etc.). <br> 2 Copy unformatted data (without price characters, pad characters, etc.). |
| Example | $\mathrm{R}, 4,3,1,3,1,1$ \| |

Copies data from field \#3, starting at the first position and copying three characters. In the destination field, the information is placed in position 1 and copied as formatted data.

## Merging Fields

You can copy data to merge the contents of fields. Use the copy data option as many times as necessary to copy all the appropriate fields into the merged field.

In the following example, two text and two non-printable fields are shown. Data from these fields is merged to form field 5 , and is then printed as a bar code.

Field Data Field Type

| 1 | 203 | Non-printable |
| :--- | :--- | :--- |
| 2 | 339 | Non-printable |
| 3 | 8 | Text |
| 4 | BLUE | Text |
| 5 | 2033398 BLUE | Bar Code |

To create this sequence:

1. Define fields $1,2,3$, and 4 .
2. Define field 5 as a bar code. Allow enough characters in the bar code field to hold all the copied characters.
3. Apply Option 4 to field 5 once for every source field.

## Sub-Fields

You can copy a segment of data from one field into a new location, called a sub-field. For example, extract part of the data in a bar code and display it in text form in a sub-field. Then, use the copy data option.

## Option 30 (Pad Data)

You can add characters to one side of a field to "pad" the field. Padding allows you to fill in the remaining spaces when the entered data does not fill an entire field.

If a variable length field is not completely filled with batch data, this option fills the remaining positions in the field with the character designated by Option 30.

Syntax
R, 30,L/R,"character" |

R1. $R \quad$ Option Header.
R2. $30 \quad$ Option 30.
$R 3 . L / R \quad$ Indicates type of padding
$\begin{array}{ll}\mathbf{L} & \text { Pad field on left side } \\ \mathbf{R} & \text { Pad field on right side }\end{array}$
R4. "character"
Pad character must be within the 0-255 decimal range and enclosed inside quotation marks.
Note: Do not use on fixed length fields.
Example
R, 30,L, "X" |

Pads data with an " $X$ " on the left side of the field.

## Sample Use for Padding

If you have a variable length bar code that you want to occupy a fixed amount of space on the supply, use pad characters. If the maximum number of characters in the bar code is 15 , but the batch record only has 10 characters, the padding option fills the remainder of the field with pad characters.

## Option 31 (Calculate Check Digit)

The printer generates a check digit if you apply Option 31 to the field. You cannot use this option if the field contains a UPC, EAN, or Code 39 (with the MOD43 check digit) bar code.

Syntax R,31,gen/ver, check digit \# ।
R1. $R \quad$ Option Header.
R2. 31
Option 31.
R3. gen/ver Enter $\mathbf{G}$ to generate a check digit.
R4. check digit \# Specifies a check digit scheme. Enter a number that identifies a check digit scheme that has been defined. For more information, see "Using Check Digits." Range: 1-10.

## Example R,31,G,5 ।

Generates a check digit using the previously defined check digit scheme 5.

You can apply options that will insert monetary symbols automatically. Do not use this option with Option 31 (define a check digit) or Option 60 (increment or decrement a field). This option is not recommended for bar codes. When determining the maximum number of characters, add the maximum number of digits and the monetary symbols.

```
Syntax R,42,appearance code |
R1.R Option Header.
R2.42 Option 42.
R3. appearance Enter 1 to print price field in standard notation, as defined by country setting.
    code
Use the monetary formatting packet to select monetary notations and symbols by country setting.
See "Defining the Monetary Formatting Packet" for more information.
See Appendix C, "Symbol Sets/Code Pages," to make sure the monetary symbol you want to use is
printable in the font selected for this field. For monetary symbols other than the dollar sign, use the
internal symbol set.
Example R,42,1 |
```

Uses a price field that prints the monetary symbol and notations as defined in the monetary formatting packet.

## Option 50 (Bar Code Density)

You can apply this option to bar code fields when you want to create custom densities. When you apply this option, it overrides the density value in the bar code field.

Do not use Option 50 with UPC or EAN bar codes. When using this option, set the density parameter in your bar code field to the default value. You can only use this option once for each bar code field. This option overrides the density selected in the bar code field.

Bar codes produced using Option 50 may not be scannable. The additional character gap, narrow space, and wide space parameters are valid only with Code 39 and Codabar. If these parameters are specified for any other bar codes, they will be ignored by the printer.
Syntax R,50,narrow,wide,gap,nar_space,wide_space ।

R1. $R \quad$ Field Option Header.
R2. $50 \quad$ Option 50.
R3. narrow Dot width of the narrow element. Range: 1-99.
R4. wide Dot width of the wide element. Range: 1-99.
R5. gap Additional dot space between characters. Enter a value of 1-99. (Code 39 and Codabar only.)
R6. nar_space Additional dot width of the narrow bar code space. (Code 39 and Codabar only). Range: 1-99.
R7. wide_space Additional dot width of the wide bar code space. (Code 39 and Codabar only). Range: 1 - 99.
Example $\quad \mathrm{R}, 50,4,8,4,4,8$ ।
Creates a custom bar code density with a narrow element of 4 dots, a wide element of 8 dots, a gap of 4 dots, 4 additional dot widths for the narrow bar code space, and 8 additional dot widths for the wide bar code space (if this is a Code 39 or Codabar bar code).

## Option 51 (PDF417 Security/Truncation)

You can define a security level and choose whether or not to truncate a PDF417 bar code. Higher security levels add data to a bar code, improving scan reliability. Some damaged bar codes may still be scannable if the security level is high enough. You can use this option to create standard PDF417 bar codes or use the truncated option to create a narrower bar code. This option can appear only once per PDF417 field, in any order, following the bar code field.

As the security level is increased, so is the size of your PDF417 bar code. For each level increased, the bar code will double in size.

Syntax R,51,security,stand/default ।
$R 1 . R \quad$ Option Header.
R2. 51 Indicates Option 51.
R3. security Security level ranges from 0-8 ( $\mathbf{0}$ is the default).
Higher security levels add data to a bar code, improving scan reliability. Some damaged bar codes may still be scannable if the security level is high enough.

R4. stand/def Truncation selector. Valid values:
S (default) a standard PDF417 bar code
T truncated
Example R,51,2,S
Defines a security level of 2 for a standard PDF417 bar code.

## Option 52 (PDF417 Width/Length)

This option defines the image width or length of a PDF417 bar code. If you define a fixed number of columns (width), the bar code expands in length. If you define a fixed number of rows (length), the bar code expands in width.

Column value does not include start/stop or left/right indicator columns.
If this option does not immediately follow the PDF417 bar code field, the default settings are used. You can only use this option once per PDF417 bar code field.

Syntax R,52,row/column,dimension ।
R1. $R \quad$ Option Header.
R2. 52 Indicates Option 52.
R3. row/column Indicates if you are defining the number of rows or columns.
R Row
C Column
If you specify rows, the bar code expands in columns, or vice versa.
R4. dimension The number of rows or columns defined for the bar code. The default is 4. Valid values:

3-90 for rows
1-30 for columns
Example R,52,C,10 ।
Defines the column width of 10 , which expands the PDF417 bar code length by 10.

## Option 60 (Incrementing/Decrementing Fields)

You may have an application, such as serial numbers, in which you need a numeric field to increment (increase in value) or decrement (decrease in value) on successive tickets within a single batch. Incrementing or decrementing can be applied to numeric data only. If you have a field that includes letters and digits, apply incrementing or decrementing to only the portion of the field that contains digits. Do not use with Option 42 (price field).

Syntax
R,60,I/D,amount,l pos,r pos

R1. $R \quad$ Option Header.
R2. 60 Option 60.
R3. I/D I incrementing field
D decrementing field
R4. amount Amount to increase or decrease. Range: 0-999.
R5. I pos Leftmost position in inc/dec portion of field. If this value is not entered, the default value 1 is used.
Range: 0-2710.
R6. rpos Rightmost position in inc/dec portion of field. If this value is not used, the entire field length is used as the default. Range: 0-2710.

## Example $\mathrm{R}, 60, \mathrm{I}, 5,1,6$ ।

Increments a field by 5 each time the field is printed. The field increments beginning with the first left position and ending with the sixth position.

## Fixing the First Number in the Incrementing Sequence

There are two ways to enter the first number in the incrementing sequence. You can use batch data or use Option 1 to define the first number as a fixed character. The first number in the sequence must contain the same amount of digits as the highest number to be counted. For example, to count the numbers 1 to 999, the first number in the sequence must be entered as 001.

If you have a constant field that appears on top of a non-constant field, apply this option to the constant field. For example, you may create a tag for an item on sale. The tag shows both the old and the new prices, but has a line drawn through the old price.

The constant field can be a line, a box, a graphic, or constant text. This option redraws the constant field when the other field changes. If you do not use this option, the field may appear broken.

Syntax
R1. R

$$
\mathrm{R}, 61 \text { । }
$$

R2. 61 Option Header.

Option 61.
Example

$$
R, 61
$$

Reimages the constant field that appears next to a variable field.

Re-Image ON

Re-Image OFF

In the above example, Option 61 was applied to the bar code field to keep the incrementing field (Box \#) from blocking out the bar code field.

## Using Check Digits

Check digits are typically used to ensure that a text or bar code field scans correctly. If you apply Option 31, the printer calculates a check digit. A check digit scheme determines how the printer calculates a check digit. When you define a check digit scheme, you assign a number to identify it. This number is later entered in box R4 when you apply Option 31 to a field. You can use check digits with text or bar code fields. Check digit calculations are performed on numeric data only. Do not use check digits with price fields. Do not define a check digit scheme for UPC, EAN, Code 39 (with the MOD43 check digit), and Code 93 bar codes, because they have predefined check digits.

| Syntax | \{A,selector, action, device,modulus, fld_length, D/P,"weights" |
| :---: | :---: |
| A1. A | Check Digit Header. |
| A2. selector | Assign a number from 1-10 to this check digit formula. |
| A3. action | The action to perform. Enter $\mathbf{A}$ to add the check digit scheme. |
| A4. device | Format storage device. Options: <br> R RAM (default) When you turn off the printer, items saved in RAM are lost. <br> F Flash Memory. When you turn off the printer, items saved in Flash memory are saved. |
| A5. modulus | Number from 2-11. The modulus is used to divide the sum of products or the sum of digits. |
| A6. fld_length | The maximum number of characters the field will contain. Range: 0-2710. |
| A7. $D / P$ | Algorithm. The algorithm determines how the check digit is calculated. Options: <br> D sum of digits <br> P sum of products |

A8. "weights" String of digits used for calculation. A weight string is a group of two or more numbers that is applied to a field. The number of digits in this string should equal the number in fld_length. Enclose in quotation marks. Range: 0-2710.

## Example

$$
\{A, 1, A, R, 10,5, P, " 65432 " \mid
$$

Adds check digit scheme number 1 to the printer's memory. The modulus is 10 , the maximum number of characters in the field is 5 . The check digit is calculated by using the Sum of Products and the string of digits used in the calculation is " 65432 ."

## Sum of Products Calculation

This is an example of how the printer uses Sum of Products to calculate a check digit for this data:
$\begin{array}{lllllllll}5 & 2 & 3 & 2 & 4 & 5 & 2 & 1 & 9\end{array}$

1. Weights are applied to each digit, starting with the last digit in the weight string. They are applied right to left, beginning at the right-most position of the field. Remember, a weight string must contain at least two different numbers. This example has a weight string of 1,2,3,4:

| field: | 5 | 2 | 3 | 2 | 4 | 5 | 2 | 1 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| weight string: | 4 | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 |

2. Each digit in the field is multiplied by the weight assigned to it:
field:
weight string:
products:

$$
\begin{array}{ccccccccc}
5 & 2 & 3 & 2 & 4 & 5 & 2 & 1 & 9 \\
4 & 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 \\
\hline 20 & 2 & 6 & 6 & 16 & 5 & 4 & 3 & 36
\end{array}
$$

3. Next, the product of each digit is added together. This is the sum of the products.
$20+2+6+6+16+5+4+3+36=98$
4. Divide the sum of the products by the modulus ( 10 in this case), only to the whole number. The balance is called the remainder.

$$
\begin{array}{r}
10 \begin{array}{r}
98 \\
\frac{90}{8}
\end{array}
\end{array}
$$

5. Subtract the remainder from the modulus.

The result becomes the check digit. In this case, the check digit is 2 .
$10-8=2$

## Sum of Digits Calculation

This is an example of how the printer uses Sum of Digits to calculate a check digit for this data:
$\begin{array}{lllllllll}5 & 2 & 3 & 2 & 4 & 5 & 2 & 1 & 9\end{array}$

1. Weights are applied to each digit, starting with the last digit in the weight string. They are applied right to left, beginning at the right-most position of the field. Remember, a weight string must contain at least two different numbers. This example has a weight string of 1,2,3,4:
field: $\quad \begin{array}{lllllllll}5 & 2 & 3 & 2 & 4 & 5 & 2 & 1 & 9\end{array}$

weight string: $\quad$| 4 | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

2. Each digit in the field is multiplied by the weight assigned to it:
field:
weight string: products:

| 5 | 2 | 3 | 2 | 4 | 5 | 2 | 1 | 9 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 4 | 1 | 2 | 3 | 4 | 1 | 2 | 3 | 4 |
| 20 | 2 | 6 | 6 | 16 | 5 | 4 | 3 | 36 |

3. Next, the digits of the products are added together. Two-digit products are treated as two separate digits. This is the sum of the digits.
$2+0+2+6+6+1+6+5+4+3+3+6=44$
4. Divide the sum of the digits by the modulus (10 in this case), only to the whole number. The balance is called the remainder.

10 \begin{tabular}{r}
4 <br>

| 44 |
| :---: |
| 40 |
| 4 | <br>

\hline
\end{tabular}

5. Subtract the remainder from the modulus.

The result becomes the check digit. In this case, the check digit is 6 .
$10-4=6$

## CREATING GRAPHICS

This chapter provides information on how to

- map out the graphic image using the hexadecimal (hex) or run length method.
- create a graphic packet using a graphic header, bitmap, duplicate, next-bitmap, text, constant text, line, and box fields.
- place a graphic image into a format.

You can use graphic packets to create bitmapped images. To include a graphic packet within your format, your format must contain a graphic field. See "Placing the Graphic in a Format" for more information.

A printed image is formed through a series of dots. Each square on the grid below represents a dot on the printhead. The graphic image is created by blackening dots in a specific pattern. You can print varying shades of gray according to the concentration of dots on the image. When the dots are printed together, the end result is a graphic image.

## Determining a Method

You can use one of two methods to map out your graphic image:
Hex Method The dot sequences are segmented into binary numbers and then converted to hex numbers.

A graphic using gray-scaling, several slanted lines, or several vertical lines typically translates more efficiently with hex representation.

## Run Length Encoding Method

The dot sequences are segmented into black and white strings within a row. The total count of each white string is converted to a lower-case letter, corresponding to numeric value. The total count of each black string is converted to an uppercase letter, corresponding to numeric value. This method can reduce imaging time for graphics that contain repetitive rows of dots. A graphic with horizontal lines or very few white-to-black borders typically translates more efficiently with run length encoding.

The most efficient encoding method depends on how complicated your graphic image is and whether or not imaging time is a concern. You may want to experiment with both encoding methods to get optimal performance.

## Designing Bitmapped Images

Once you determine the encoding method to use, you can begin mapping out your graphic image.

Note: The image that you map must be an upside down mirror image of the final result.

## Special Considerations

Solid black print cannot exceed $25 \%$ of any given square inch of the supply. If the black print exceeds this limit, you may lose data or damage the printhead.

In the first label, the large " M " logo and thick black line exceed the allowed black to white print ratio. In the second label, the large " $M$ " logo does not exceed the black to white print ratio.

## Using the Hex Method

The following steps explain how to derive a hex character string from a bitmapped graphic.
Each square on the grid represents a dot. A black square indicates the dot is ON, and a white square indicates the dot is OFF. A sequence of binary numbers, called a bit pattern or bitmap, determines what dots are on and off. The numbers " 0 " and " 1 " are used for this purpose. The number " 1 " turns a dot on and "0" turns a dot off.

1. Assign 1 to every black square and 0 to every white square.

| 1111100000000000000000000111111111111111111100000000000000000011111111110000 11111000000000000000000011111111111111111100000000000000000001111111000000 0000011111111111111111111111111111111111111111111111111111110000111000000 111111000000000000000000011111111111111111100000000000000000001111111000000 11000000011111111111111111111111111111111111111111111111100000000111000000 000011111111111111111111111111111111111111111111111111111110000111000000 01111 000000 00000 000000000001 00000 111110000000000000000000000000000000000000000000000000000000011111111111111111110000000 1100000000111111111111111111111111111111111111111111111111100000000111000000 0111111111111111000000000000000000000000000000000001111111111111100000000 111110000000000000000000111111111111111111100000000000000000001111111000000 000001111111111111111111111111111111111111111111111111111111111110000111000000 111110000000000000000000111111111111111111110000000000000000000111111110000000 00000111111111111111111111111111111111111111111111111111111110000111000000 01111111111111000000000000000000000000000000000111111111111100000000 |
| :---: |

2. Section off the grid in columns of eight. If any rows are not divisible by 8, add enough 0's to complete a column.

| 00000000 | 0000000 | 00000000 | 00011111 | 11000000 | 00000000 | 00000111 |  | 11111111 | 00000000 | 00000000 | 00011111 | 1100 |
| 000000 | 0000000 | 00000000 | 00011100 | 00000011 | 11111111 | 1111111 | 1111111 | 11111111 | 11111111 | 11111110 | 0000001 | 110000 |
|  | 00 |  |  | 0011 | 1111 | 1111 |  |  | 1111 | 1111 | 111 |  |
|  |  |  |  |  | 11110000 | 0000000 | 0000000 | 00000000 |  |  |  |  |
| 00000010 | 0000000 | 00000000 | 00011111 | 11000000 | 00000000 | 00000111 | 11111111 | 11111111 | 00000000 | 00000000 | 000111 | 1100000 |
|  | 00000 |  |  |  |  |  |  |  |  |  |  |  |
| 00000000 | 1110000 | 00000000 | 00000011 | 11111111 | 11110000 | 0000000 | 0000000 | 00000000 | 00000000 | 01111 | 11111110 | 00000000 |
| 0000000 | 11111100 | 00000000 | 00011100 | 00000011 | 11111111 | 1111111 | 1111111 | 11111111 | 11111111 | 11111110 | 00000011 | 11000000 |
|  | 111 |  |  | 0011111 | 11111111 | 1111111 |  | 111 | 1111 | 11111111 | 11100011 |  |

3. One row at a time, convert each group of eight binary digits to hex.
starting at position 49 ...
$00111111=3 \mathrm{~F}$
$1111111=\mathrm{FF}$
$1111111=\mathrm{FF}$
$11110000=F 0$
4. Write the hex values for each row as a continuous string.
row 1, position $49=03 F F F F F F 00000$
5. Repeat steps 3 through 4 for each row on the grid.
6. Insert the hex values in syntax format.

## Using the Run Length Encoding Method

The following steps explain how to derive a run length character string from a bitmapped graphic.

Each square on the grid represents a dot. A black square indicates the dot is ON, and a white square indicates the dot is OFF.

Note: For visual clarity, the following example shows " 1 " to indicate when a square is ON, and " 0 " to indicate when a square is OFF. You do not have to convert your dots when using the run length method.

1. Count the number of consecutive OFF or ON dots in a row. Write the number of consecutive dots in sequence for the first row on the grid. Write "ON" or "OFF" after each number to indicate ON or OFF dots.
```
(row 1, position 50) 26 on
(row 2, position 39) }11\mathrm{ on, 26 off, }9\mathrm{ on
(row 3, position 34) }5\mathrm{ on, }45\mathrm{ off, }6\mathrm{ on
```

2. Replace each number you have written with its corresponding code from the Dot to Run Length Encoding Chart provided in Appendix C, "Symbol Sets/Code Pages." Be sure to use CAPITAL letters for black dots and lower-case letters for white dots.

26 on (Z)
11 on (K), 26 off (z), 9 on (I)

If the number is greater than 26 , write $z$, followed by the letter corresponding to the amount over 26. For example, to represent 45 off dots, write zs.

```
5 on (E), 45 off (zS), 6 on (F)
```

3. Write the letter codes in sequence, uninterrupted, for each row.
```
(row 1,position 50) Z
(row 2,position 39) KzI
(row 3,position 34) EzsF
(row 4,position 30) DpZoD
```

Note: If the end of the line specifies OFF dots (lower-case letters), the ending lower-case letters can be omitted. For example, uZFu can be written as uZF.
4. Repeat steps 1 through 5 for each row on the grid.
5. Insert the code values in syntax format.

## Determining How to Store the Image

Once you have mapped out your graphic image, determine how you want to store it. You have several options:

- RAM
- Temporary Storage
- Flash

## Using RAM

You should use RAM when the graphic image is used by several formats, because you only have to send the graphic image once. This eliminates the need to send the graphic image repeatedly. See "Placing the Graphic in a Format," for more information about using the graphic packet in a format. Graphics smaller than approximately $1 / 2$ inch by $1 / 2$ inch can be stored in printer RAM and referenced by the graphic ID number.

Note: Graphics are stored in the image buffer and remain there until another format is sent or the printer is turned off.

## Using Temporary Storage

You should use temporary storage when the graphic image is used only in one format or your graphic image is very large. Graphic data in temporary storage is held in the image buffer until the graphic is printed. Then, it is cleared from memory when you send a new or updated batch. You can use the same graphic image multiple times on a format. Send the graphic image to the printer after the format to which it applies.

If a graphic is stored in temporary storage, do not place a graphic field in the format. This causes an error. Instead, position the graphic image by using the row and column locations in the graphic packet header.

Image memory (temporary storage) accepts a graphic packet 2436 rows long with 384 dots per row.

## Using Flash

You can use flash memory when the graphic image is used by several formats, because you only have to send the graphic image once. This eliminates the need to send the graphic image repeatedly. See "Placing the Graphic in a Format," for more information about using the graphic packet in a format.

Your graphic packet can contain

- bitmapped fields (for bitmapped images)
- constant text fields
- lines
- boxes.

Images using hex representation or run length encoding are bitmapped images. See "Designing Bitmapped Images" to design your bitmapped image.

Once you design your graphic image, you are ready to define a graphic packet. This packet generates the graphic image you use in a format.

## Positioning the Graphic Image

This section explains how to position the graphic image within a graphic packet header, a field of a graphic packet, or within a format.

## Within the Graphic Packet Header

When you are using RAM, the row and column parameters in the graphic header are usually 0,0 , because placement is controlled by the graphic field in your format.

When you are using temporary storage, these parameters control the placement of the graphic image on the supply.
The area enclosed within the dotted lines represents the graphic image starting at 0,0 (as defined in the graphic header).

If you want a fixed amount of white space around your graphic image, use something other than 0 for row and/or column.

The area enclosed within the dotted lines represents the graphic image starting at $\mathbf{0 , 0}$ with a fixed amount of white space $(10,10)$ around the graphic image.

## Within the Field

In a bitmap, constant text, line, or box field, the row and column parameters control where an individual field or bitmapped row begins in relation to the coordinates defined in the graphic header.

The bottom of the triangle in this example represents the first field of the graphic packet starting at $\mathbf{1 0 , 0}$.

## Within a Format

When you define the graphic field within your format, the row and column parameters represent where on the format to place the graphic image.

If you are placing a graphic (a logo, for example) within a certain area on your supply, enter the starting position (bottom left corner) of the graphic image.

This label shows the triangle "logo" beginning (the bottom left corner) at 155, 33 as defined in the graphic field.

## Pat's <br> Parts

3/8 inch Wire 3.55/8 Pack

## Defining the Graphic Header

Every graphic packet must contain a graphic header. This is the first thing you enter. It identifies and provides important measurement and formatting information for the graphic. Bitmap, duplicate, next-bitmap, constant text, line, and box fields follow the graphic header, if they are used.

| Syntax | \{G,graphID, action, device, units, row, col, mode, "name" |
| :---: | :---: |
| G1. G | Graphic Header. |
| G2. graphID | Unique number from 0-999 to identify the graphic image. |
| G3. action | The action to perform to the graphic. Options: <br> A Add the graphic. <br> C Clear the graphic from the printer. |
| G4. device | Graphic storage device: |
|  | F Flash Memory (saved when the printer is turned off) <br> R Volatile RAM (format must contain a graphic field) <br> T Temporary Storage |
|  | Note: If you are using flash memory, send the graphic only once. Then, send only batches to reference it. If you re-send the graphic each time, it creates separate copies, and eventually fills up flash memory. |
| G5. units | Unit of measure. Options: |
|  | E English, measured in $1 / 100$ inches <br> M Metric, measured in $1 / 10 \mathrm{~mm}$ <br> G Graphic, measured in dots. For bitmapped graphics, G is the only valid option. |
| G6. row | Distance between the bottom of the graphic image area and the first bitmap line. This is usually 0 , unless you want a fixed amount of white space around the graphic image. See "Positioning the Graphic Image," for more information. |
|  | English $0-365$ <br> Metric $0-927$ <br> Dot $0-741$ |
| G7. column | Distance between the left edge of the graphic image area and the left edge of first bitmap line. This is usually 0 , unless you want a fixed amount of white space around the graphic image. See "Positioning the Graphic Image," for more information. |
|  | English $0-189$ <br> Metric $0-480$ <br> Dots $0-383$ |
| G8. mode | Imaging mode. Enter 0. |
| G9. "name" | Graphic name (optional), 0-8 characters, enclose in quotation marks. |

Adds a graphic image identified by number 99 to volatile RAM. The graphic uses dot measurement. The image will be placed according to the row and column parameters in the graphic field. The imaging mode is 0 and the image is called 99 Wire .

## Creating Bitmap Fields

This defines one row of dots, starting at a specific row and column within the graphic image. Each unique row of dots requires a bitmap field. A bitmap field can later be repeated by using a duplicate field.
Syntax
B,row, column,algorithm,"data" ।

B1. B
Bitmap Field.
B2. row
Distance (in dots) from the graphic image's bottom margin to the bitmap line.

| English | $0-365$ |
| :--- | :--- |
| Metric | $0-927$ |
| Dot | $0-741$ |

B3. column Distance (in dots) from the graphic image's left edge to the bitmap line.

| English | $0-189$ |
| :--- | :--- |
| Metric | $0-480$ |
| Dots | $0-383$ |

B4. algorithm Coding method for bitmap data:
H Hex Representation
R Run Length Encoding
B5. data Character string made up of hex or run length encoding. Do not put spaces or any other character between the numbers. Range: 0-2710.

## Example \{B,39,56, H, "3FFFFFFO" |

Defines a bitmapped graphic field. The image begins 39 dots from the bottom and 56 dots from the left edge of the graphic area. Hex representation is used.

## Creating Next-Bitmap Fields

This field uses the previous field's row and column locations. It allows you to use the bitmap or duplicate field data without having to recalculate row and column locations. This field represents one row of dots on the image.
Syntax
N,adjdir,adjamt,algorithm,"data" |

N1. N
N2. adjdir

## Next-Bitmap Field.

Increments or decrements the row count. Inserts the duplicate line after or before the current row.
0 Increments (inserts after)
1 Decrements (inserts before)
For example:
B,50,35,R,"GsSsG" |
N,0,1,R,"DpZoD" |
prints a next-bitmap field on row 51 at column 35 .
N3. adjamt Amount of row adjustment in dot rows. Using 0 overwrites the same line. Range: 0-999.
N4. algorithm Coding method for bitmap data:
H Hex Representation
R Run Length Encoding

## Example B,39,56, H, "3FFFFFFO" | <br> N, 0, 1, H, "OOOOOOEOOOOO" |

Defines a next-bitmap graphic field beginning on row 40. The row count increments by 1. Hex representation is used.

## Creating Duplicate Fields

If a line of data is identical to a previous bitmap or next-bitmap field, the duplicate field allows you to repeat the dot sequence without retyping the data. A duplicate field represents one row of dots on the image.

Note: Duplicate fields are useful when you have a graphic with a lot of repetition.
Syntax D,adjdir,adjamt, count I
D1. D Duplicate Field.

D2. adjdir Increments or decrements the row count. Inserts the duplicate line after or before the current row.
0 Increments (inserts after)
1 Decrements (inserts before)
For example:
B,50,35,R,"GsSsG" |
D, 0,20,2 |
inserts row 50 again at row 70 and row 90 . Rows 70 and 90 do not have to be defined later.
D3. adjamt Amount of row adjustment in dot rows. Range: 0-999. The above example adjusts the duplicate field to image on row 70 and 90 (adding 20 to the current row count).

D4. count Number of times to duplicate the line. Range: 0-999.
Example B,117,24,H,"03FFFFFFFFFFFFFFFFFFC" | D, 0, 1, 2 |

Defines a duplicate field that is imaged after the bitmap line. This field duplicates the preceding bitmap line twice (at row 118 and 119).

You can use constant text, line, or box fields in a graphic packet to create a compliance label overlay. See Chapter 2, "Defining Fields," for more information about these fields.

## Sample Hex Graphic Packet

```
{G,99,A,R,G,0,0,0,"99WIRE" |
B,39,48,H,"3FFFFFF0" |
B,40,32,H,"01FFC000000FF8" |
B,41,32,H,"3E00000000000FC0" |

```

## Placing the Graphic in a Format

To include a graphic within a format:

1. Design the graphic image as shown in "Designing Bitmapped Images."
2. If you are using RAM, place a graphic field in the format file to reference the graphic. See the following section, "Defining the Graphic Field," for more information.

Note: If you are using temporary storage, you do not need a graphic field in your format to reference the graphic image.
3. Download all the necessary packets (check digit, format, etc.).
4. Send the graphic file to the printer, if you have not already done so. See "Creating a Graphic Packet" for more information.

The graphic field in a format references the graphic image by the graphID in the graphic header. This field is required only if the graphic will be stored in RAM.

Syntax G,graphid,row,col,mode,rotation |
G1. G
G2. graphID
G3. row

G4. column

G5. mode
G6. rotation

## Example

Defines a graphic field that is identified by the number 57 . The image begins at 0,0 . The imaging mode is 0 and there is no rotation.

## Sample Bitmap Graphic Image

The following format shows the graphic packets (hex and run length) in a sample format.

```
{F,2,A,R,E,200,200,"FMT2" |
G,99,132,30,0,0 |
Q,146,30,198,95,5,""
T,1,5,V,175,100,0,1004,1,1,B,L,0,0,0 |
T,2,5,V,150,100,0,1004,1,1,B,L,0,0,0
T,3,15,V,120,25,0,1003,1,1,B,L,0,0,0 ।
T,4,15,V,95,35,0,1003,1,1,B,L,0,0,0 |
L,S,84,15,84,195,10,"" |
B,5,12,F,30,65,1,2,40,1,L,0 | }
```

## CONFIGURING THE PRINTER

This chapter discusses how to

- upload the printer's configuration or font information.
- configure the printer using online configuration packets.
- use immediate commands to control the printer's operation at any time.

## Using Online Configuration Packets

Use online configuration packets to change the printer's settings. You can send an individual configuration packet or a single packet containing all the configuration packets. Supply all parameters for each packet.

Make a copy of the online configuration worksheet in Appendix D, "Format Design Tools," and save the original. Packets A - M are listed on the worksheet.

When you turn off the printer, all the information in the online configuration packets is saved and used when the printer is turned back on. After you change printer configurations, you must resend the format, batch, or graphic to the printer before the changes take effect.

Note: Some of these settings can be set offline or in an application.
Always include an I, immediately after the left bracket \{ and before the packet identifier (A, B, $C$, etc.). The I parameter identifies the data stream as a configuration packet.

Note: Include the I parameter with each packet if you are sending them individually. Include it only at the beginning of a data stream if you are sending multiple packets.

This is the syntax to use when you create online configuration packets:
Syntax

Syntax for single packet

| \{ |  | Start of Header <br> I, <br> A, parameter <br> $\}$ |
| :--- | :--- | :--- |
| Configuration Header |  |  |
| Syntax |  | System Setup |

Uploads the printer configuration from nonvolatile RAM and returns the following to the host.

```
A,0,0,0,1,0 |
B,0,0,1,0,0 ।
C,0,0,0,0,0,0 |
D,1,0,2 |
E,"~123~044~034~124~125~126","","~013~010" |
F,3,1,0,0,1 |
M,R,R,160 |
M,T,R,20 |
M, I, R,320 |
M, D,N,1280 |
M, F,N,640 |
M,V,R,1280 |
```

The parameters for each packet ( $\mathbf{A} \mathbf{- M}$ ) are displayed. Ignore the line beginning with $G$. In the first line that begins with M, 8725 is the total volatile memory available, 1345 is the memory used in volatile RAM. 2535 is the total non-volatile memory available, 615 is the memory used in non-volatile RAM. The remaining lines beginning with $\mathbf{M}$ list the buffer sizes in $1 / 10 \mathrm{~K}$ for the Receive, Transmit, Image, Downloadable Fonts, Formats, and Scalable Fonts Buffers.

## Configuration Syntax Guidelines

When creating a printer configuration packet:

- Follow the "Standard Syntax Guidelines" listed at the beginning of this manual.
- The first character after the start of header (\{) is the configuration header (I).
- Include the first five ANSI codes, at a minimum, in the control characters packet.
- If you change any of the online configuration packets, resend the format packet to the printer, so the configuration changes take effect.

## Defining the System Setup Packet

Use the system setup packet (A) to select the power up mode, display language, print separators between batches, print a "slashed zero," and select the symbol set.

$$
\text { Syntax } \quad\{\mathbf{I}, \mathrm{A}, \text { powup_mode, language,sep_on,slash_zero,symbol_set | \}}
$$

A1. A System Setup Packet

A2. powup_mode Online Mode. Enter 0.
A3. language Display Language. Enter 0 (for English).

A4. sep_on Batch Separators. Enter 0.
A5. slash_zero Slash Zero. Options:

$$
\begin{array}{ll}
\mathbf{0} & \text { Print a standard zero (default) } \\
\mathbf{1} & \text { Print a zero with a slash through it }
\end{array}
$$

A6. symbol_set Symbol Set. Use 0 for the Internal Symbol Set. For scalable or TrueType® fonts, use:

```
1 ANSI
2 Code Page 437 (Latin U.S.)
3 Code Page }850\mathrm{ (Latin 1)
4 Code Page 1250 (Latin 2)
5 Code Page 1251 (Cyrillic)
6 Code Page 1252 (Latin 1)
7 Code Page 1253 (Greek)
8 Code Page 1254 (Turkish)
9 Code Page 1255 (Hebrew)

\section*{ANSI}
```

Code Page 437 (Latin U.S.)
Code Page 850 (Latin 1)
Code Page 1250 (Latin 2)
Code Page 1251 (Cyrillic)
Code Page 1252 (Latin 1)
Code Page 1253 (Greek)
Code Page 1254 (Turkish)
Code Page 1255 (Hebrew)
Code Page 1256 (Arabic)
Code Page 1257 (Baltic)
Code Page 1258 (Vietnamese)
DOS Code Page 852 (Latin 2)
DOS Code Page 855 (Russian)
DOS Code Page 857 (IBM Turkish)
DOS Code Page 860 (MS-DOS Portuguese)
Unicode
BIG5
GB2312
SJIS (Shift JIS) to SJIS (Code Page 932, Japanese)
GB2312 to GB2312 (Code Page 936, Simplified Chinese)
BIG5 to BIG5 (Code Page 950, Traditional Chinese)

```

Note: The Standard, Reduced, Bold, OCRA and HR fonts only support the Internal Symbol Set (0). The CG Triumvirate \({ }^{\text {TM }}\) typefaces support only the ANSI and DOS Code Page 437 and 850 Symbol Sets. The scalable font (font\#50) does not support Code Page 1256 (Arabic). Code pages 852-860 and 1250-1258 are for downloaded TrueType fonts or the scalable font. Code pages 102-107 require the print engine memory expansion option and a downloaded International TrueType font. TrueType fonts are designed to be regionally specific; therefore, all code pages may not be supported in a given font. See Appendix C, "Symbol Sets/ Code Pages" for more information.

Example \(\{\mathbf{I}, \mathrm{A}, 0,0,0,1,0 \quad \mid\}\)
Powers up the printer in the online mode, displays prompts in English, does not print a separator after each batch, prints zeros with slashes through them, and uses the internal symbol set.

\section*{Defining the Supply Setup Packet}

Use the supply setup packet (B) to select supply type, ribbon, feed mode, supply position, and cut position.

Syntax
B1. B Supply Setup Packet
B2. supply_type
Supply Type. Options:
\(0 \quad\) Black mark supply (default)
2 Continuous (non-indexed) supply
Note: You may need to adjust the print contrast (in the Print Control packet), based on the type of supply you are using.

B3. ph_energy Printhead Energy setting based on the supply loaded. Options:
0 Standard Supplies
1 Special (fax paper)
2 High Energy (synthetic)
B4. feed_mode Feed Mode. Options:
\(0 \quad\) Continuous operation (default)
1 On-demand mode
B5. supply_posn Supply Position. Range: -99-99 in \(1 / 203\) inch. \(\mathbf{0}\) is the default. Do not change this setting. If you need to move the printing for a pre-printed area, change the print adjustment.

Example \(\quad\{\mathrm{I}, \mathrm{B}, 0,2,1,0 \mid\}\)
Indicates black mark synthetic supply has been loaded, causes the printer to operate in on-demand mode, and does not adjust the supply position.

\section*{Defining the Print Control Packet}

Use the print control packet (c) to set the contrast, print, and margin adjustment, print speed, and printhead width.

Syntax
\{I,C,contrast,print_adj, margin_adjust,speed_adj,ph_width | \}
C1. C Print Control Packet
C2. contrast Print Contrast. Range: -28-40. 0 is the default. You may need to adjust this value depending on the type of supplies you are using. For example, synthetic supplies require a higher print contrast, but receipt paper requires less contrast.

C3. print_adj Print Adjustment (position). Range: -99-99 in 1/203 inch. \(\mathbf{0}\) is the default. Adjusts where data prints vertically on the supply. Increase the print position to move print up, decrease to move print down for a pre-printed area.

C4. margin_adj Margin Adjustment (position). Range: -99-99 in 1/203 inch. \(\mathbf{0}\) is the default. Adjusts where data prints horizontally on the supply. Increase the margin position to move print to the right, decrease to move print to the left.

C5. speed_adj Print Speed in inches per second (ips). Options:
0 The printer determines the print speed automatically. This is the default.
40 Formats not containing serial bar codes print at 4.0 ips .
The printer does not print less than 3.0 ips when this is selected.
Note: Serial bar codes, lines, and graphics print at 2.0 ips. Synthetic supplies and special supplies print at 1.5 ips .

C6. ph_width
Width of the printhead in dots. Use \(\mathbf{0}\).
Example \(\{\mathbf{I}, \mathrm{C}, 0,0,0,40,0\) \}

Uses the default contrast, print adjustment, margin adjustment, prints at 4.0 ips when possible, and uses the default printhead width.

The monetary formatting packet (D) selects the monetary symbols to print for a price field. Use the monetary formatting packet to select primary and secondary monetary symbols, and designate the number of digits to appear at the right of a decimal.
Syntax
\{I, D, cur_sym, secondary,decimals | \}

D1. D Monetary Formatting Packet
D2. cur_sym
Currency Symbol. Options:
\begin{tabular}{|c|c|}
\hline 0 & No symbol \\
\hline 1 & USA (\$, Dollar- default) \\
\hline 2 & UK (£, Pound) \\
\hline 3 & Japan ( \(¥\), Yen) \\
\hline 4 & Germany ( M , Deutsche Mark) \\
\hline 5 & France (F, Franc) \\
\hline 6 & Spain (P, Peseta) \\
\hline 7 & Italy (L., Lira) \\
\hline 8 & Sweden (Kr, Krona) \\
\hline 9 & Finland (K, Markka) \\
\hline 10 & Austria (\%, Shilling) \\
\hline 11 & India (Rs, Rupee) \\
\hline 12 & Russian (\%, Ruble) \\
\hline 13 & Korean (W, Won) \\
\hline 14 & Thai (B, Baht) \\
\hline 15 & Chinese ( \(¥\), Yuan) \\
\hline 16 & Euro ( \(¢\) ) \\
\hline
\end{tabular}

Note: To use these symbols, select the internal symbol set.
D3. secondary Secondary Sign. Options:
\(\begin{array}{ll}0 & \text { No secondary sign (default) } \\ 1 \text { Print secondary sign }\end{array}\)
Note: Secondary symbols only print if you designate at least one decimal place.
D4. decimals Number of digits to the right of the decimal. Options:
\begin{tabular}{ll}
\(\mathbf{0}\) & No digits \\
\(\mathbf{1}\) & One digit \\
\(\mathbf{2}\) & Two digits (default) \\
\(\mathbf{3}\) & Three digits
\end{tabular}

Example \(\{\mathbf{I}, \mathrm{D}, 1,1,2 \mid\}\)
Prints the dollar sign, uses a secondary symbol, and places two digits to the right of the decimal.

\section*{Defining the Control Characters Packet}

Use the control characters packet ( E ) to enable and disable the immediate commands. Do not change the MPCL control characters.

Changes take effect with the first character following the end of header character \} of the configuration packet. Each control character must be unique and cannot appear anywhere else in your packet, except within quotation marks. You can customize the trailer characters to work with your host.

Use the following syntax for the control characters packet. Notice all but the first parameter are within quotation marks.

You must send the control characters packet to enable the immediate commands. An immediate command will execute immediately, even if it is embedded within quotation marks, and all data following the command in the string will be ignored.

Example \(\{\mathbf{I}\), E, "~123~063~034~124~125~126~094" | \}
Enables immediate commands by defining the \({ }^{\wedge}(\sim 094)\) symbol as the command identifier. The other MPCL control characters do not change.

\section*{Using Immediate Commands}

Immediate commands affect printer operation as soon as the printer receives them, even if they are included within a packet or used inside quotation marks.

You can use immediate commands to change immediate command or status polling control characters, reset the printer, or cancel and repeat batches.

\section*{Enabling Immediate Commands}

When the printer is first turned on, these commands are not available. To use these commands, you must first send the control characters packet and define the immediate command control character. The immediate command control character is saved in non-volatile RAM so it is not lost after you turn off the printer. Once the immediate command control character is defined, the immediate commands are enabled.

\section*{Sending Immediate Commands}

Immediate commands consist of a three- or four-character sequence you can send in a packet or embed in your application. Each command must be sent separately.

\author{
Syntax control character_immediate command
}

The printer can accept only one immediate command at a time. Sending a command before the previous one is completed can result in an error.

\section*{Example \({ }^{\wedge}\) CB}

Immediately cancels the batch currently printing unless an error exists in the printer. This example assumes that the defined immediate command control character is the caret ( \(\wedge\) ).
\begin{tabular}{|c|c|}
\hline Command & Parameter \\
\hline \({ }^{\wedge} \mathrm{CA}\) & Cancels all the batches in the queue unless an error exists on the printer. \\
\hline \({ }^{\wedge} \mathrm{CB}\) & Cancels only the current batch being printed unless an error exists. \\
\hline \(\wedge D D\) or \({ }^{\wedge} \mathrm{DCd}\) & Disables the MPCL data escape character (the tilde) and inhibits MPCL from acting on ANY data escape sequence from the host. Sets the MPCL data escape character to the ASCII value given by the d parameter. The value can be any ASCII character. \\
\hline \({ }^{\wedge} \mathrm{EA}\) & \begin{tabular}{l}
Aborts an error condition. This command is the same as pressing Escape to clear an error. May need to be sent multiple times. Use ^ \(R B\) to reprint batch. \\
Caution: This command causes the current batch to stop and the condition that caused the error to remain uncorrected.
\end{tabular} \\
\hline ^ER & Resets the error. This command is the same as pressing Enter to acknowledge an error. Normal operation resumes. \\
\hline \({ }^{\wedge} \mathrm{FD}\) & \begin{tabular}{l}
Feeds a label when printer is idle. Simulates the operation of pressing the trigger and dispenses the next label if printer is in the on-demand mode. \\
Note: Printer ignores this command if printing.
\end{tabular} \\
\hline \({ }^{\wedge} \mathrm{ID}\) or \({ }^{\text {A }}\) ICd & Disables the Immediate Command feature by turning off the Immediate Command escape character. Sets the Immediate Command escape character to the ASCII value given by the d parameter. The value can be any ASCII character. Use \({ }^{\wedge}\) IE to enable immediate commands. \\
\hline \(\wedge \mathrm{MC}\) & Returns the customer ID or RPQ version to the host. (00-99) \\
\hline \(\wedge \mathrm{MD}\) & Returns the printhead dot density to the host. \(\mathbf{0 0}=203 \mathrm{dpi} 01=300 \mathrm{dpi}\) \\
\hline \(\wedge \mathrm{MF}\) & Uploads the MIF file to the host. \\
\hline \({ }^{\wedge} \mathrm{MI}\) & Returns the customer ID or RPQ revision level to the host. (00-99) \\
\hline ^MM & Returns the model number to the host. \(30=6039\) \\
\hline \({ }^{\wedge} \mathrm{MP}\) & Returns the prototype number to the host. (00-99) \\
\hline \({ }^{\wedge} \mathrm{MR}\) & Returns the revision number to the host. (00-99) \\
\hline \({ }^{\wedge} \mathrm{MS}\) & Returns the flash file system information (fonts). \\
\hline \({ }^{\wedge} \mathrm{MV}\) & Returns the version number to the host. (00-99) \\
\hline \({ }^{\wedge} \mathrm{PR}\) & Resets the printer. This command takes five seconds to complete and then the printer is ready to receive data. It has the same effect as turning off and then turning on the printer. Note: Command should be used only when the printer is not printing. \\
\hline \({ }^{\wedge}\) RB & \begin{tabular}{l}
Repeats the last printed batch, printing the same number of labels as specified in the original batch. This command does not work if using batch separators. \\
Note: Printer ignores this command if printing.
\end{tabular} \\
\hline
\end{tabular}
\begin{tabular}{c|l}
\hline \hline Command & \multicolumn{1}{c}{ Parameter } \\
\hline \hline\(\wedge\) ^RS & \begin{tabular}{l} 
Resynchronizes supply when supply roll is changed. \\
Note: Printer ignores this command if printing.
\end{tabular} \\
\hline ^SD or ^SCd & \begin{tabular}{l} 
Disables the status polling feature by turning off the status polling control character. Sets \\
the status polling control character to the ASCII value given by the d parameter. The value \\
of d can be any ASCII character.
\end{tabular} \\
\hline\(\wedge\) AF & \begin{tabular}{l} 
Uploads the print engine memory expansion status as N/A (not installed) or Installed \\
(memory expansion is ready for use).
\end{tabular} \\
\hline\(\wedge\) ^TP & \begin{tabular}{l} 
Prints a diagnostic label set. \\
Note: Printer ignores this command if printing.
\end{tabular} \\
\hline ^UD & \begin{tabular}{l} 
Uploads the print engine memory expansion's directory. The list of files and their sizes are \\
returned to the host.
\end{tabular}
\end{tabular}

The table represents the defined immediate command control character as \({ }^{\wedge}\) and the defined status polling control character as d. You may define these characters to suit your needs.

Note: To use the immediate command control character or the status polling character within your data, use the tilde sequence.

\section*{Example ^UD}
```

File Name: PCL_223.TTF, File Size: 4516
File Name: PCL`160.INI, File Size: 64 File Name: PCL_160.TTF, File Size: 3180584 File Name: PCL-50.INI, File Size: 64 File Name: PCL_50.TTF, File Size: 95840 File Name: PCL-100.INI, File Size: 64 File Name: PCL_100.TTF, File Size: 4516 File Name: PCL-147.INI, File Size: 64 File Name: PCL_147.TTF, File Size: 5669904 File Name: PCL_139.INI, File Size: 0 File Name: PCL_139.TTF, File Size: 252800 File Name: PCL`142.INI, File Size: 64
File Name: PCL_142.TTF, File Size: 6354884
File Name: PCL-}131.INI, File Size: 64
File Name: PCL_131.TTF, File Size: 2145892
K bytes Free: \overline{4}70896

```

The "PCL_" designates a font file, the number is the font number used in the text or constant text field and ".TTF" designated a True Type font file. The size of the file is shown in bytes.

\section*{Defining the Communication Settings Packet}

Use the communication settings packet (F) to set the baud rate, word length, stop bits, parity, and flow control for serial communications. Do not change the communication settings.

Syntax
F1. F Communication Settings Packet
F2. baud Baud Rate. Enter 7 for 115200.
F3. word_length
Word Length. Enter 1 for an 8-bit word length.
F4. stop_bits Stop Bits. Enter 0 for 1-stop bit.
F5. parity Parity. Enter 0 for None.
F6. flow_control Flow Control. Enter 3 for XON/XOFF.
Example \(\{\mathbf{I}, \mathrm{F}, 7,1,0,0,3 \mid\}\)
Uses 115200 baud, an 8 -bit word length, one stop bit, no parity, and XON/XOFF mode.

\section*{Defining the Memory Configuration Packet}

Use the memory configuration packet \((M)\) to customize the size of your printer's buffers, which gives you greater flexibility in your formats.

Memory must be allocated in 1/2K increments. The memory configuration packet does not accept decimals, so enter whole numbers. Multiply the amount to reallocate (in K) by 10. For example,
\begin{tabular}{c|c}
\hline \hline To reallocate (in K) & Enter this amount \\
\hline \hline 1 & 10 \\
\hline 1.5 & 15 \\
\hline 2 & 20 \\
\hline 2.5 & 25 \\
\hline 153 & 1530 \\
\hline 229.5 & 2295
\end{tabular}

Each buffer's allocated memory remains in effect until that buffer is reallocated. For this reason, you may want to reallocate all the buffers when reallocating any buffer. If you reallocate more memory than you have available, you will receive an error.

Syntax \{I,M,buffer,device,buffer_size | \}
M1. M Memory Configuration Packet

M2. buffer Buffer type. Options:
D Downloadable Fonts
F Format
I Image
R Receive
T Transmit
V Scalable (vector) fonts
M3. device Storage type. Use R (volatile RAM)
Note: You cannot reallocate flash memory.
5-40 \(\quad\) Transmit (16 is the default)
20-160 Receive ( 64 is the default)
160-1142 Image ( 380 is the default)
\(160-1280\) Format \((320\) is the default)
\(640-1280\)
Downloadable Fonts ( 640 is the default)
\(10-1280\)
Scalable Fonts ( 640 is the default)

Note: For the scalable font buffer, specify 10 if you do not use the buffer. When using the buffer, specify a minimum of 40 .

The larger the number you specify for the image buffer, the longer your formats can be. As a rule of thumb, divide the value you select by 100 , and round up to the next whole number. That number will be the length in inches.

Example \(\{\mathbf{I}, \mathrm{M}, \mathrm{I}, \mathrm{R}, 1530\) | \(\}\)
Stores the image buffer in volatile RAM and allocates 153K for it.

\section*{Checking Current Buffer Sizes}

Send a configuration upload packet to check the sizes of your current buffers. See "Configuration Packet Header" for more information. After you check your current buffer sizes you can begin reallocating memory.

If you want to increase your image buffer and you will not be using scalable fonts, add that memory into your image buffer.

\section*{Example}
\begin{tabular}{lll}
\(\{\mathrm{I}, \mathrm{M}, \mathrm{R}, \mathrm{R}, 20\) | & Receive buffer & 2 K \\
\(\mathrm{M}, \mathrm{T}, \mathrm{R}, 10\) & Transmit buffer & 1 K \\
\(\mathrm{M}, \mathrm{D}, \mathrm{N}, 80\) | & Downloadable fonts & 8 K \\
\(\mathrm{M}, \mathrm{V}, \mathrm{R}, 160\) | & Scalable fonts buffer & 16 K \\
\(\mathrm{M}, \mathrm{I}, \mathrm{N}, 3200 \mid\) Image buffer & 320 K
\end{tabular}

Make sure memory is available before adding memory to a buffer. In the above example, if the image buffer ( \(\mathrm{M}, \mathrm{I}, \mathrm{N}, 3200\) ) was defined before the downloadable fonts and scalable fonts buffers (M,D,N,80 and M,V,R,160) were defined, an error would have occurred.

\section*{About Memory Buffers}

Transmit Buffer Used to send ENQ, job, and upload responses. This buffer must be allocated as volatile (R) RAM.

Receive Buffer Used to save data received from the host before it is processed by the printer. Changing this buffer size affects the amount of data the printer can receive without using flow control. This buffer must be allocated as volatile (R) RAM.

\section*{Image Buffer}

Used to image the current format. To use supply lengths greater than 4.0 inches, you must reconfigure memory. An image up to 11.65 inches can be created by increasing the image buffer. You may not be able to use scalable or downloadable fonts if you have allocated memory from these buffers into your image buffer. Use the formula below to calculate the required image buffer size.
```

21K x Length

```

Length is the length of your label in inches.

\section*{Example \(\quad 21 \mathrm{~K} \times 6.5=136.5 \mathrm{~K}\)}
(Multiply by 10 and round up.)
\(136.5 \mathrm{~K} \times 10=1365\)
Enter 1365 for your Image buffer.
Format Buffer Used to store formats, batch data, and graphics. Use the following formula to calculate the required format buffer size:

Linecount x 50/1024
Linecount is the number of lines in your format packet including the format header and all the options.

The result of the above calculation is in kilobytes.

Downloadable Fonts Buffer

\section*{Scalable (Vector) Fonts Buffer}

Used to store downloaded soft TrueType fonts. To determine the size of your downloadable fonts, send a font packet. The file size, in bytes, is the minimum amount needed in this buffer. See "Using the Font Packet" for more information.

Used to image the scalable or downloaded TrueType font characters. Increasing this buffer size allows more characters to be saved in cache memory, so the characters do not have to be re-built the next time they are printed. Use 0 if you are not using scalable/TrueType fonts. This buffer must be allocated as volatile (R) RAM.

The printer does not print the fonts if there is not enough memory in this buffer to image them.

\section*{Buffer Worksheet}

Make copies of this page to use as a buffer worksheet.

\section*{Buffer Allocation Considerations}

Keep these items in mind when allocating memory.
- Do not allocate more memory than what is available.
- Free memory from one buffer before you add it to another buffer.
- Reallocate all the buffers if you need to reallocate any buffer.
- Send all buffer (re)allocations in one packet. The printer evaluates each individual buffer allocation separately. If one buffer allocation is invalid, the entire packet is invalid. For example, if you send
```

{I,M,R,N,20 |
M,T,N,60 |
...}

```
the printer ignores the entire packet, because the second line allocates 6 K for the transmit buffer, and 4 K is the maximum for that buffer. If you define a buffer size that exceeds the maximum value, an error occurs. However, no information is lost.
- Whenever the printer accepts a memory configuration packet, it takes effect immediately, causing a printer reset. Any information contained in the buffers is lost. Resend your formats, batches, graphics, or fonts to the printer.
- If you remap your image buffer, make sure the length and width specified in your format header are not too large for the current image buffer. In other words, if you remap for a \(2 \times 6\) inch label, you cannot print a \(2 \times 8\) inch label without receiving an error, until you change your format header or increase your image buffer.

\section*{Memory Considerations with Downloaded TrueType Fonts}
- The size of the TrueType font file, in bytes, is the minimum amount of memory you must have available in the downloadable fonts buffer.
- The scalable (vector) fonts buffer is used to image the downloaded fonts (TrueType). If you are using several downloaded TrueType fonts, you may need 100K or more in this buffer. The printer does not print the fonts if there is not enough memory in the scalable (vector) fonts buffer.
- To use large point sizes (greater than 60 point), you must reconfigure memory and increase the size of the scalable (vector) fonts buffer.

\section*{Clearing Packets from Memory}

You may want to remove packets from the printer to increase memory storage capacity or if the formats/fonts are no longer needed. In some cases, turning the printer off may clear the packets from memory. If not, send a format clear packet.
```

Syntax {header,packet\#,action,device | }

1. header Identifies the packet. Options:
A Check Digit Scheme
F Format
G Graphic
W Font
2. packet\# Identification number of the packet to clear (1-999) or font number ( $\mathbf{0}-\mathbf{9 9 9 9})$. $\mathbf{0}$ is for all fonts.
3. action Enter $\mathbf{C}$ to clear the packet.
4. device Storage device. Options:
F Flash Memory
R Volatile RAM
Example $\{\mathrm{F}, 1, \mathrm{C}, \mathrm{R} \mid\}$
Clears Format \#1 from volatile RAM.
```

\section*{Using the Font Packet}

You can use a font packet to add or clear downloaded fonts from memory, upload your font buffer, font data, or the cell size information for a particular font. The font packet is useful when you are downloading fonts. If you are using downloaded fonts, the font number and the number of bytes each downloaded font uses is listed.

This packet does not list the number of bytes the standard printer fonts use.
Use the MONARCH® MPCL Toolbox Font Utility (available on our Web site) to create the font header and data. Refer to the online help for more information.

Syntax
\{W,font\#, action,device,data_length,data_record | \}
W1. W Writable Font Header.
W2. font\# The font identifier from \(\mathbf{0}\) - 32000. Use \(\mathbf{0}\) to specify all fonts.
W3. action Action. Options:
A Adds the specified font.
C Clears all or specified fonts, except ones in flash.
H Uploads font size information.
M Uploads font memory usage information.
W4. device Device. Options:
F Flash
M Print engine memory expansion (must use for International fonts)
R Volatile RAM
Z All devices (use for upload).
W5. data_length The length of the font data. The range is 68-16384.
(optional)
If you are creating fonts, you need to have font data included with this packet.
W6. data_ Multiple data records define the font. The first character is either an record (optional) \(\mathbf{H}\) (hex) or an \(\mathbf{R}\) (run-length), referring to the algorithm. The rest of the record is up to 2710 characters of font data in double quotes. Separate the algorthm and the data with a comma, and end the record with \(\mid\).

Example \(\{W, 0, M, R \mid\}\)
Selects all fonts and checks the memory usage in RAM. The printer returns the following to the host:
\[
\{W, 0, M, R \mid
\]

Number of bytes free, Number of bytes used | \}
Example \(\{\mathrm{W}, 0, \mathrm{H}, \mathrm{Z} \mid\}\)
Selects all fonts and uploads the font size information for any downloaded fonts.

The printer returns the following to the host:
\begin{tabular}{|c|c|}
\hline \multicolumn{2}{|l|}{\(\{\mathrm{W}, 0, \mathrm{H}, \mathrm{Z}\) |} \\
\hline 0,1,0,"Standard", 0, 0, 0, 14, 22,14,22,3 & Spacing \\
\hline \multicolumn{2}{|l|}{0,2,0, "Reduced", 0, 0,0,7,14,7,14,1 |} \\
\hline 0,3,0, "Bold", 0, 0, 0,24,34,24,34,3 & Baseline \\
\hline \multicolumn{2}{|l|}{0,4,0, "OCRA", 0, 0, 0, 13, 24, 13, 24, 3 ।} \\
\hline \multicolumn{2}{|l|}{0,5,0, "HR1", \(0,0,0,12,26,12,20,2\) l CellHeight} \\
\hline \multicolumn{2}{|l|}{0,6,0,"HR2", 0, 0, 0, 10,16,10,16, 1 |} \\
\hline \multicolumn{2}{|l|}{0,10,0,"CGTriBd9", 1, 0, 7, 25,31,10,15,0 |} \\
\hline \multicolumn{2}{|l|}{\multirow[t]{2}{*}{\begin{tabular}{l}
\(0,10,1\), CGGTriBd9", 1, 0, 7, 25, 31, 10, 15, 0 |
\[
0,10,437, \text { CGGTriBd9", 1, 0, 7, 25, 31,10,15,0 }
\] \\
Nominal Width
\end{tabular}}} \\
\hline & \\
\hline \multicolumn{2}{|l|}{0,10,850,"CGTriBd9", 1, 0, 7, 25,31, 10, 15, 0 ।} \\
\hline \multicolumn{2}{|l|}{\multirow[t]{2}{*}{\begin{tabular}{l}
0,11,0,"CGTriumv6",1,0,5,17,21,5,10,0 \\
Nominal Height
\end{tabular}}} \\
\hline & \\
\hline \multicolumn{2}{|l|}{0,11,437, "CGTriumv6", 1, 0, 5, 17, 21, 5, 10, 0, Pri_ Printhead Density} \\

\hline \multicolumn{2}{|l|}{0,1007,0,"CGTriBd8", 1, 0, 7, 22, 29, 8, 14,0 ।} \\
\hline \multicolumn{2}{|l|}{\multirow[t]{2}{*}{0,1008,0, "CGTriBdio", 1, 0, 8, 28, 35,10,17,0 _ Font Style}} \\
\hline & 0,1005,0,"CGTriBd12",1,0,9,33,41,11,22,0 | \\
\hline \multicolumn{2}{|l|}{\multirow[t]{2}{*}{\(0,1010,0, " C G T r i B d 18 S ", 1,0,10,42,49,17,34,0\) | CellWidth
\(0,1011,0, " C G T r i B d 22 S ", 1,0,12,51,60,21,42,0\) |}} \\
\hline & \\
\hline \multicolumn{2}{|l|}{0,1012,0,"LGothBd6.5", 0, 0, 5, 9, 21, 6, 10, 1 |} \\
\hline \multicolumn{2}{|l|}{0,1013, 0, "LGothBd9", 0, 0, 7, 14, 31, 10, 15, 2__ FontName} \\
\hline ,50,0,"Swiss Bold",1,1,95840 & \\
\hline
\end{tabular}

Spacing Monospaced (0) or proportional (1).
Type \(\quad\) Bitmapped (0) or scalable (1).

\section*{Baseline Bottom of the font.}

Cell Width Horizontal number of dots to contain the widest character.
Cell Height Vertical number of dots to contain the tallest character.
Nominal Width Average width for lower-case letters.
Nominal Height Average height for lower-case letters.
Inter-Character Default spacing between characters in monospaced fonts.
Gap
Printhead Density Displays a (0) for the 203 dpi printhead.

\section*{Uploading Format Header Information}

You can upload format header information from the formats in memory to check the supply length and width for each format.

Syntax
\{header,format\#, action, device | \}
F1. header Format Header
F2. format\# Format number from 0-999. 0 is for all formats in memory.
F3. action Action. Options:
A Adds the specified format
C Clears the specified format
H Uploads format header information
F4. device Device. Options:
R Volatile RAM
Z All devices (use for upload)
Example \(\{\mathrm{F}, \mathrm{O}, \mathrm{H}, \mathrm{Z} \mid\}\)
Selects all formats in memory and returns the following:
```

Example {F,0,H,Z |
Fmt_1,406,406 |
Fmt_10,324,406 |
Fmt_15,812,812 |
Fmt_20,305,609 |
Fmt_25,1218,406 | }

```

Displays the format number, supply length and supply width (in dots) for each format in memory.
Example \(\{\mathrm{F}, 1, \mathrm{H}, \mathrm{Z} \mid\}\)
Selects format1 and returns the following to the host:
```

{F,1,H,Z |
Fmt_1,406,406 | }

```

Displays the supply length and supply width (in dots) for format1.

5-18 Configuring the Printer

\section*{PRINTING}

This chapter describes how to define the batch header, batch control, and batch data files.

\section*{Defining the Batch Header}

Batch data is the actual information printed on the supply. Batch data fills in the format's text, bar code, and non-printable text fields.

A batch packet contains the following three parts:
batch header identifies the format and how many labels to print.
batch control defines the print job.
batch data defines the actual information printed on the label. (optional)

A batch header begins the file. It tells which format the batch uses and how many labels to print. To record batch data, make a copy of the worksheet in Appendix D, "Format Design Tools."

Syntax \{B,format\#,N/U, quantity |
B1. B Batch Header.
B2. format\# Format number (0-999) to use.
\(B 3 . N / U \quad\) Controls how image is generated.
N New (default). Erase image and re-image all fields using online data. Any missing fields will be blank.
U Update last image with one or more fields. All other fields remain the same as the last queued batch.

B4. quantity Quantity to print (1-999).
Note: Using 0 pre-images the field to reduce the imaging time for labels. See "Batch Quantity Zero Method" for more information.

Example \(\{B, 1, N, 1\}\)
Defines a batch header that uses format \#1 and reimages all fields using the online data. One label is printed with this batch.

\section*{Defining the Batch Control Field}

The batch header must precede this field. The batch control field defines the print job and applies only to the batch that immediately follows.

Syntax E,feed_mode,batch_sep,print_mult,multi_part |
E1. \(E \quad\) Batch Control Field.
E2. feed_mode Feed Mode. Options:
0 Continuous Feed (default)
1 On-Demand
E3. batch_sep Batch Separator. Use 0.
E4. print_mult Number of tags (1-24) with the same image. 0 is the default.
E5. multi_part Number of identical parts on one tag (1-5). 0 is the default.
Example \(\quad \mathrm{E}, 0,0,1,1\) ।
Defines a batch control field. Continuous feed mode is used and no separator prints between batches.

\section*{Defining Batch Data Fields}

Batch data fields should be sent in field number order. Use continuation fields for large amounts of data. If you are using \(N(N e w)\) in the batch header, you must list all fields with your data in sequence. If you are using \(U\), you need to list only those fields and data that changes from the last printed batch.

Syntax field\#,"data string" | C,"continuation" ।
field\# Identifies the text, bar code, or non-printable text field in which to insert the following data. Range: 0-999.
"data string" Provides the actual information to appear in fields. Enclose in quotation marks. Length: 0-2710 characters.

C Optional. Identifies information to be appended to the data string.
"continuation"
Optional. Provides the actual information to be added to the batch packet. Enclose in quotation marks. Use this option to break up longer fields. Length: 0-2710 characters.

\section*{Example}
```

1,"Size 12" |
2,"" |
3,"Blue" |
C,"and this would be appended." |

```

Defines a batch data field. "Size 12" prints in field \#1, a blank line appears in field \#2, "Blue and this would be appended" prints in field \#3.

\section*{Using Special Characters in Batch Data}

There are two ways to specify special characters in batch data:
- Place a tilde ( \(\sim\) ) before each character.
- Use a tilde with the decimal ASCII equivalent.

For example, you can use "" or ~034 to print the " character in your batch data; otherwise, the tilde characters are ignored. You can also use \(\sim X X X\) where \(X X X\) is the decimal equivalent of an unprintable character.

\section*{Sample Batch Data with Special Characters}
\begin{tabular}{c|c|c}
\hline \hline\(\{B, 1, N, 1 \mid\) & Decimal Character & What Prints \\
\hline \hline \(1, " 123 \sim 034456789 "\) । & \(\sim 034\) is " & \(123 " 456789\) \\
\hline \(2, " \sim 094983 \sim\) '126LG4451" । & \begin{tabular}{c}
\(\sim 094\) is \(\wedge\) \\
\(\sim 126 ~ i s ~\)
\end{tabular} & \(\wedge^{\wedge}\)
\end{tabular}

\section*{Merged or Sub-Fields}

If a field is completely filled by data copied from other fields, use quotation marks without spaces between them for data string.

\section*{Incrementing Fields}

In incrementing fields, the first number in the sequence must contain the same number of digits as the highest number to be counted. For example, to increment the numbers in a field from 1-999, enter the starting number in the batch as 001.

\section*{Downloading Methods}

You can download the format and batch data using one of three methods: sequential, batch, and batch quantity zero.

\section*{Sequential Method}

Using the sequential method, you send all your format and batch data at one time. Use this method when your application does not require operator intervention to input data. All data is sent down at one time, and the printer then images each field. As soon as the last field is imaged, your labels begin to print.

\section*{Batch Method}

This is similar to the sequential method, but it is used when you want to send multiple batches. All data for the first batch is sent at one time, and the printer then images each field. As soon as the last field for the first batch is imaged, labels begin to print. This process is repeated for each subsequent batch.

\section*{Example \{Format\}}
\{Batch Packet\}
\{Batch Packet\}

\section*{Batch Quantity Zero Method}

You may use the batch quantity zero method when your application requires operator intervention to enter data. While the operator is entering data, the previous field is sent with a batch quantity of zero. The printer images the field, but does not print it. After the operator enters the data for the last field, the batch quantity can be specified. The last remaining field is imaged, and the label prints almost immediately.

To use the batch quantity zero method:
1. Send the format and a batch header in one file. The first time you send the batch header, use the parameter \(\mathbf{N}\) (new batch), and the parameter \(\mathbf{0}\) for (zero quantity). This ensures the label is properly positioned.

The printer images constant text, line, and box fields, but does not print them.
2. Input data for each field, and send it with a batch header using the parameter \(\mathbf{U}\) (batch update) and a quantity of zero. When the printer receives the data, it immediately images the field, but does not print it.

At this time, the printer is imaging all associated fields, including fields that copy from other fields.
3. Repeat step 2 for each field except the last one.
4. For the last field, input data and send a batch header with the quantity of labels you want printed. When the printer receives input for the last field, it immediately prints the labels. See "Reducing Imaging Time" in Chapter 8 for an example using the batch quantity zero method.

\section*{Modifying Formats}

The optional entry method is a quick way to modify your format fields, check digit fields and configuration packets.

\section*{Optional Entry Method}

This method enables you to reset only the parameters you want to change. Commas act as placeholders for unchanged parameters. The optional entry method reduces file size and increases the speed at which files are sent to the printer.

\section*{TROUBLESHOOTING}

7
This chapter explains how to
- print diagnostics labels
- reset the printer
- call Technical Support.

This chapter also provides explanations of your printer's errors. The errors are classified by type and are listed in order. If you have trouble loading supplies or performing maintenance, refer to your Operator's Handbook.

Follow the directions provided with the error description to correct the problem. If you cannot clear an error, turn off the printer, wait several seconds and then turn on the printer. Call Technical Support if you receive any error message not listed in this chapter.

\section*{Printing Diagnostics Labels}
1. Select the printer icon from status bar on the display.
2. Select Printer Diagnostics.
3. Select Printer from the Printer Diagnostics menu.
4. Select Diagnostic Labels from the Printer Tests menu.
5. Select Diag Label from the Diagnostic Labels menu.

Two diagnostic labels print. The diagnostic labels show the printer's configuration, as well as the model number and software version number. Refer to the System Administrator's Guide to print the checkerboard, grey scale, serial and parallel quality labels.
With version 2.0 or greater software, the printer has International font capability.

\section*{Reading Diagnostics Labels}

The first diagnostic (test) label shows the model number, software version, and the printer's configuration by packet. See Chapter 5, "Configuring the Printer," for more information about the printer's configuration.

The second diagnostic (test) label shows the model number, software version, total number of inches printed, voltage, print contrast, printhead resistance, number of bad dots, and memory. In the example above:
- The printer has printed 505 inches of regular supplies
- The printer has printed no high-energy (synthetic) supplies
- No options are set
- CONTRAST POT does not apply.

\section*{If You Receive an Error Message}

Any time you receive a message that is not described in this manual, or the recommended action does not solve the problem, call Technical Support.

\section*{Calling Technical Support}

Technical support representatives are available Monday through Friday during regular business hours. Their number is listed on the back cover of this manual. Follow these steps before you call:
1. Make sure your PC and printer are properly connected.
2. Record any error messages that occurred.
3. Recreate the problem, if you can.
4. Check your port settings. Your problem may corrected simply by changing the communication settings.
5. List any changes that have recently been made to the system. Try to record what you were doing when the problem occurred.
6. Reboot your computer. Refer to your computer documentation for specific instructions.
7. Print the Diagnostics labels. See "Printing Diagnostics Labels" for more information.

If these steps do not solve the problem, call Technical Support.
Have the following information ready before you call:
- computer brand name and type of software or terminal brand name and model
- Monarch printer model
- printer serial number
- support agreement, contract number, or invoice information
- customer number

\section*{Data Errors}

A data error indicates that incorrect data was received from the host, causing the printer to ignore the entire print job. After checking the packet and correcting the problem, transmit the print job again.

The following is a list of data errors. These errors occur because data in the format, batch, check digit, font, or graphic packet is invalid.

\section*{Format Errors}

\section*{Error Description}

\section*{Code}

001 Format ID number must be 1-999.
Name must be 1-8 characters inside quotes or a printer-assigned name ("").
Action must be A (add) or C (clear).
Supply length is invalid (maximum is 4"). See "Defining the Format Header" in Chapter 2 for valid lengths.

Supply width is invalid (maximum is 2"). See "Defining the Format Header" in Chapter 2 for valid widths.

Storage device must be \(\mathbf{R}\) (volatile RAM), \(\mathbf{T}\) (temporary storage), or \(\mathbf{F}\) (flash memory).
Unit of measure must be E (English), M (Metric), or G (Dots). See "Defining the Format Header" in Chapter 2 for more information.

Field ID number is outside the range 0-999.
Field length exceeds 200.
Row field position is greater than the maximum stock dimension. See "Defining Text Fields" in Chapter 2 for valid row lengths.

013 Column field position is greater than the maximum stock dimension. See "Defining Text Fields" in Chapter 2 for valid column widths.

014 Font style is invalid. Must be 1, 2, 3, 4, 5, 6, 10, 11, 50, 1000, 1001, 1002, 1003, 1004, 1005, 1006, 1007, 1008, 1009, 1010, 1011, 1012, or 1013. See "Defining Text Fields" in Chapter 2 or Appendix B, "Fonts," for more information.

Character rotation must be 0 ( 0 degree), 1 ( 90 degree),
2 (180 degree), or 3 (270 degree). See "Defining Text Fields" in Chapter 2 for more information.

Field rotation must be 0 ( 0 degree), 1 ( 90 degree), 2 (180 degree), or 3 (270 degree).
See "Defining Text Fields" in Chapter 2 for more information.
Field restriction must be V (variable) or \(\mathbf{F}\) (fixed).
Text field symbol set selection defined in the field must be \(\mathbf{0}\) (Internal), 1 (ANSI), 100 (Macintosh), 101 (Wingdings), 102 (Unicode), 103 (BIG5 for Unicode), 104 (GB2312 for Unicode), 105 (SJIS for Unicode), 106 (GB2312), 107 (BIG5), 437 (DOS Page 437), 850 (DOS Page 850), 852 (Latin 2), 855 (Russian), 857 (Turkish), 860 (Portuguese), 1250 (Latin 2), 1251 (Cyrillic), 1252 (Latin 1), 1253 (Greek), 1254 (Turkish), 1255 (Hebrew), 1256 (Arabic), 1257 (Baltic), or 1258 (Vietnamese). See "Defining Text Fields" in Chapter 2 for more information.

Vertical magnification must be 1-7 or for TrueType/Scalable fonts, use 4-250 (the point size).

Horizontal magnification must be 1-7 or for TrueType/Scalable fonts, use 4-250 (the point size).

Color must be B, D, O, R, or W. See "Defining Text Fields" in Chapter 2 for more information.

Intercharacter gap must be 0-99 dots.
Field justification must be B (balanced), C (centered), E (end), \(\mathbf{L}\) (left), or \(\mathbf{R}\) (right). See "Defining Text Fields" in Chapter 2 for more information.

Data length is too long.
Bar code height must be at least 1 (English), \(\mathbf{2}\) (Metric), \(\mathbf{1}\) (Dots), or is not within the supply dimensions.

Human readable option must be
1 no CD or NS
5 NS at bottom, no CD
6 CD at bottom, no NS
\(7 \quad C D\) and NS at bottom
8 no text
Bar code type is invalid. See "Defining Bar Code Fields" in Chapter 2 for valid options.

Bar code density is invalid. See "Defining Bar Code Fields" in Chapter 2 for the bar code density chart.

GS1 DataBar bar code symbol type is invalid. The range is \(\mathbf{1}\) to 12 . See "Defining Bar Code Fields" in Chapter 2 for more information.

GS1 DataBar bar code separator height must be 1 or 2. See "Defining Bar Code Fields" in Chapter 2 for more information.

GS1 DataBar bar code segment width is invalid. The range is 2 to 22. See "Defining Bar Code Fields" in Chapter 2 for more information.

Line thickness must be 0-99 dots.
Line direction must be \(\mathbf{0 , 9 0} \mathbf{9} \mathbf{1 8 0}\), or \(\mathbf{2 7 0}\).
End row is invalid. Line segment or box end row is defined outside of printable area.
End column is invalid. Line segment or box end column is defined outside of printable area.

Dot pattern for line or box must be "".
Line length is defined beyond the maximum length. See "Defining Line Fields" in Chapter 2 for valid lengths.

Line type must be \(\mathbf{S}\) (segment) or \(\mathbf{V}\) (vector).
Imaging mode in the graphic header must be 0 .

\section*{Batch Errors}

\section*{Error Description}

\section*{Code}

101

\section*{Option Errors}

\section*{Error Description \\ \\ Code} \\ \\ Code}

The format referenced by batch is not in memory.
Print quantity is outside the range 0-999.
Batch mode must be \(\mathbf{N}\) (new) or \(\mathbf{U}\) (update).
Batch separator in a batch control field must be \(\mathbf{0}\) (off).
Print multiple is outside the range 1-24.
Multiple part supply is outside the range 1-5.

Option number must be 1, 4, 30, 31, 42, 50, 51, 52, 60, or 61.
Copy length is outside the range 1-2710.
Copy start position must be 1-255.
Destination start position must be 1-255.
Source field must be 0-999.
Copy type must be 1 (copy after rules) or 2 (copy before rules).

Increment/Decrement selection must be I (increment) or D (decrement).
Incrementing start position must be 0-2710.
Incrementing end position must be 0-2710.
The incrementing amount must be 0-999.
Security value for a PDF-417 bar code must be 0-8. Correct the value and resend the format to the printer.

Narrow element value is less than 1 or greater than 99 . Correct the value and resend the format to the printer.

Wide element value is less than 1 or greater than 99 . Correct the value and resend the format to the printer.

Truncation code must be S (standard) or \(\mathbf{T}\) (truncated bar code).
Aspect code must be (columns) or \(\mathbf{R}\) (rows).
Option definition must be \(\mathbf{S}\) (set) or \(\mathbf{T}\) (template).
Input device device must be D (Default), H (Host), K (Keyboard), N (None), or \(S\) (Scanner).

Pad direction must be \(\mathbf{L}\) (from left) or \(\mathbf{R}\) (from right).
Pad character is outside the range 0-255.
Check digit selection must be \(\mathbf{G}\) to generate check digit.
Primary or secondary price format is outside the range 1-16.
Data type restriction is outside the range of 1-6.
Option is not valid for the field.
Bar code intercharacter gap must be 0-99 dots. (This is also known as the additional character gap when using Option 50, Defining Bar Code Densities.)

\section*{Online Configuration Errors}

\section*{Error Description Code}

Power up mode must be 0 (online).
Language selection must be 0 (English).
Batch separator code in a system setup packet must be 0 (off).
Slash zero selection must be 0 (standard zero) or 1 (slashed zero).
Supply type must be 0 (black mark) or 2 (non-indexed).
Printhead energy must be 0 (Standard supplies), 1 (Fax paper), or 2 (Synthetic supplies).

Feed mode must be \(\mathbf{0}\) (continuous) or 1 (on-demand).
Supply position is outside the range.
Contrast adjustment must be 28-40 dots.
Print adjustment must be -99-99 dots.
Margin adjustment must be -99-99 dots.
Speed adjustment must be 0 .
Primary monetary symbol is invalid.
Secondary symbol selection must be 0 (none) or 1 (print secondary sign).
Monetary decimal places must be 0-3.
Character string length in the control characters packet must be 5 (MPCL control characters) or 7 (ENQ/IMD command character).

Baud rate selection must be 7 (115200).
Word length selection must be 1 ( 8 bits).
Stop bits selection must be 0 ( 1 bits).
Parity selection must be 0 (none).
Flow control selection must be 3 (XON/XOFF).
Symbol set (code page) in the System Setup packet must be
0 (Internal), 1 (ANSI), 2 (DOS 437), 3 (DOS 850), 4 (1250-Latin 2), 5 (1251-Cyrillic), 6 (1252- Latin 1), 7 (1253- Greek), 8 (1254- Turkish), 9 (1255- Hebrew), 10 (1256Arabic), 11 (1257- Baltic), 12 (1258- Vietnamese), 13 (852- Latin 2), 14 (855-
Russian), 15 (857- IBM Turkish), 16 (860-DOS Portuguese), 17 (Wingdings), 18 (Macintosh), 19 (Unicode), 20 (BIG5), 21 (GB), 22 (SJIS to SJIS), 23 (GB to GB), or 24 (BIG5 to BIG5).

RS232 Trailer string is too long. Use a maximum of \(\mathbf{3}\) characters.
ENQ Trailer string is too long. Use a maximum of 3 characters.
The buffer type must be \(\mathbf{T}\) (Transmit), \(\mathbf{R}\) (Receive), I (Image), F (Format), or \(\mathbf{D}\) (Downloadable Fonts).

The storage device type in the memory configuration packet must be \(\mathbf{R}\) (volatile RAM).
The buffer size is invalid.
The printhead width must be 0 .
Invalid battery voltage packet. Must be 0 or 1.
Invalid printer address in communication settings packet. Use 0 or none.

\section*{Check Digit Errors}

\section*{Error Description \\ Code}

310 Check digit scheme number must be 1-10.
311 Modulus must be 2-11.
314 Check digit algorithm must be \(\mathbf{D}\) (sum of digits) or \(\mathbf{P}\) (sum of products).

\section*{Graphic Errors}

\section*{Error Description \\ Code}

325

Duplicating direction must be \(\mathbf{0}\) (insert after) or \(\mathbf{1}\) (insert before) in duplicate fields for graphics.

Amount of row adjustment must be 0-999 dots in duplicate fields for graphics.
Duplicate count must be 0-999.
Bitmap line encoding must be \(\mathbf{H}\) (hex) or \(\mathbf{R}\) (run length).
Font selector must be 1-9999.
Font data length must be 68-16384.
Insufficient font memory is available for the downloaded font.
Job request is outside the range 0-4.
The character immediately following \(\{\) is invalid.
Internal software error. Call Technical Support.
Field separator not in expected location.
Field separator not found.
The number or string that is currently being processed is too long.
Too many fields exist in the format. You cannot have more than 200 fields in the format. Lines and box fields count as fields.

\section*{Communication Errors}

\section*{Error Description}

409 The printer memory is full. Delete unnecessary formats or graphics from memory. If you are using a graphic file that is very large, consider using another mapping method (such as run length encoding) to reduce the required memory.

410 Parity on the printer does not match the parity on the host. Check the parity setting under SETUP options.

411 Framing error. The printer cannot communicate with the host. Make sure the host is turned on, communication cables are connected correctly, port settings are correct, and communications are active. Check the baud rate, word length, and stop bits to make sure they match those at the host. Do not toggle between Microsoft Windows and MS-DOS while using the COPY command, or you will receive a framing error. Exit Windows before using the COPY command. Re-transmit the data.

There is a problem with flow control between the printer and the host. Make sure the printer and the host flow control settings match (both are DTR or both are XON/XOFF). If the error persists, call Technical Support.

413 Online receive queue is full. Check your printer's XON/XOFF or DTR SETUP values to be sure there isn't a flow control problem.

414 The internal keyboard buffer is full or you need a new keypad. Call Technical Support.
The buffer size you defined exceeds the total available in your machine.
Internal software error. Call Technical Support.

\section*{Data Formatting Failures}

Formatting errors indicate that a field will print incorrectly. After you have checked the data stream and corrected the data, retransmit the format and batch.

Note: For these errors, the batch still prints, but the field, font, bar code, or density may be incomplete, missing or contain incorrect data.

\section*{Error Description}

571 Invalid bar code length.

Invalid copy field, padded field, or incrementing field length.
Invalid price length.
No CD scheme or room for CD. The CD scheme in the batch does not fit the format or the field contains blanks.

The graphic included in your format could not be found.
An error occurred while the batch was imaging.
The batch was not found for imaging.

Font, bar code or density is invalid. The font, bar code or density in the batch does not fit the format.

The data in this line of the batch is either missing or does not match the format.
Reference point off tag.
Portion of field off tag. There may be an invalid character in the packet. Make sure you did not enter \(\mathbf{O}\) for \(\boldsymbol{\varnothing}\).

Bar code width is greater than 16 inches, or number of keywords for PDF 417 exceeds 928.

Dot shifting failed. A bad dot falls on a bar code that cannot be shifted. Call Technical Support.

Magnification must be 1-7.
An error occurred opening the TrueType font file. Select a different font to download. If the error message persists, call Technical Support.

Not enough memory to create the downloaded TrueType characters in the scalable (vector) fonts buffer. Reconfigure the printer's memory and increase the scalable (vector) fonts buffer. Resend the font, format, and batch packet after reconfiguring the memory. If the error message persists, call Technical Support.

\section*{Machine Faults}

These errors occur when there is a problem with the printer.

\section*{Error Description}

703 The printer sensed a calibration of different-sized black marks. Make sure the correct supply is loaded.

704 Printer has not sensed a supply mark within the specified number of inches or is out of supplies. Check the supply tracking, supply marks, black mark sensor position, and supply roll for binding. Change supply.

706 The motor could not get up to speed within the allotted time. Call Technical Support.
707 The motor reached the desired speed, but was unable to maintain that speed. Call Technical Support.

708 The motor has stalled or is running too slow to measure the speed. Call Technical Support.

750 Printhead is overheated. Turn off the printer to let the printhead cool. If the error persists, call Technical Support.

751
Printer did not sense a black mark when expected. The supply may be jammed.
For these errors, Check the
- supply tracking
- supply marks
- black mark sensor position
- supply roll for binding.

If the error continues to appear, change the supply.

Printer sensed a mark in the wrong place.
Printer sensed a mark that is too long.
The printer is out of supplies. Load supplies.
Load supplies. The calibrated supply length differs by plus or minus .25 inches from the format.

Check supply. Either the supply is not seen, or the on-demand sensor is broken (purchase optional). Check for a label jam. Clear the supply path or reload supplies. This error may occur if you remove a label too quickly in on-demand mode. The printer does not recalibrate after this error.

Low battery. Recharge the battery.
Waiting to dispense label.
Printhead has less than 3 bad dots.
Printhead has more than 10 bad dots or is not connected. Make sure the printhead is connected.

The printer is busy. Turn off the printer. Wait two seconds and turn it back on. Resend the packets. If the problem continues, call Technical Support.

The printer has an error pending. Turn off the printer. Wait two seconds and turn it back on. Resend the packets. If the problem continues, call Technical Support.

Printer not initialized.
Printer job queue full.

\section*{Flash Memory Errors}

These errors occur when there is a problem with the printer's flash memory.

\section*{Error Description}

Code
800 A directory in flash memory is full.
Flash memory is full.
A directory in flash memory cannot be found.
There is no directory in flash memory.
A file in flash memory is not open.
A file in flash memory is already open.
The file in flash memory is full.
813 You cannot access flash memory.

An error occurred in the flash program.
821 An error occurred while erasing flash memory.
822
There is a flash ID error.

\section*{Memory Expansion Errors}

These errors occur when there is a problem with the Print Engine memory expansion option.

\section*{Error Description}

Code
860 There is an error opening a font file on the print engine memory expansion option.
861 There is an error when writing to a file on the print engine memory expansion option.
862 There is an invalid condition for the print engine memory expansion option.

\section*{Hard Printer Failure Errors}

These errors are hard printer failures. Call Technical Support if you receive these messages.

\section*{Error Description \\ Code}

904 No memory for native layer.
907 Low RAM error.
909 RAM corrupted.
911 Version string mismatch.

\section*{SYSTEM ERROR \#\# can be:}

VECTOR \#\# 2 Bus Error
3 Address Error
4 Illegal Instruction
5 Zero Division
6 CHK, CHK2 Instructions
7 TRAP Instructions
8 Privilege Violation
9 Trace
10 Line 1010 Emulator
48 User-defined vectors (48-255)
This error is fatal. If you receive it, reset and/or reflash the printer. If the error persists, call us at the number listed on the back cover of this manual for instructions. If they determine you should send the printer back, use the original packaging (box and packing material) and include the documentation. Use the following address:

Electronic Repair Center
200 Monarch Lane
Door 39
Miamisburg, OH 45342
The warranty does not apply if you do not follow these instructions.

\section*{PRINTER OPTIMIZATION}

This chapter provides information on how to improve your printer's performance by
- adjusting the print quality
- reducing the imaging time for printing
- providing general tips and hints for designing formats.

This printer uses "smart imaging" to image and print fields on supplies. Smart imaging remembers the exact boundaries and locations of each field and places a boundary box (white space) around each field. When a field changes that particular boundary box is cleared and the new field data is imaged. However, the new field data may require a larger boundary box than the previous field did. In some cases, neighboring fields that do not change may be covered with white space from the changing field's boundary box.

Many factors affect print quality: type of supplies, print contrast, and the type of printer's application. The type of supply should match the printer's application.
- Using premium supplies reduces smudged images, hard to read labels, and faded print. Supply type, print speed, and print contrast work together to improve the print quality of labels. Contact your Paxar Representative for more information.
- If the print quality is too light or too dark, adjust the print contrast. The correct contrast setting is important because it effects how well your bar codes scan and how long the printhead lasts.

Be sure to check the print quality of bar codes with a bar code verifier or scanner. If you do not have a verifier or scanner, check the bar code visually. A bar code that is IN SPEC will have complete bars and clear spaces. Small alphanumeric characters will look complete. A bar code that is IN SPEC may not look as good as one that is too dark, but it will have the highest scan rate.

Note: For highest scan rates, make sure there is adequate white space before and after the bar code. A darker bar code does not mean it will scan better.

\section*{Reducing Imaging Time}

Imaging time is the time it takes the printer to image the data for the first label after the printer receives the format and batch packet. There are several ways to reduce the imaging time: send formats and configurations once, use a batch quantity of zero, or update batch fields.
- If the formats use the same check digit scheme, you only need to send the check digit scheme once.
- Send formats once and use the batch update field to change information on the label. Using a batch update field reduces the imaging time, because only the fields that change are imaged. All other fields remain the same as the last queued batch.
- Use the batch quantity zero method when your application requires operator intervention to enter data. While the operator is entering data, the previous field is sent with a batch quantity of zero. The printer images the field, but does not print it. After the operator enters the data for the last field, the batch quantity can be specified. The last remaining field is imaged, and the label prints almost immediately.

To pre-image a label:
1. Send the format and a batch header in one file. The first time you send the batch header, use the parameter \(\mathbf{N}\) (new batch), and the parameter \(\mathbf{0}\) for (zero quantity).

Example \(\{\mathrm{B}, 1, \mathrm{~N}, 0 \mid\}\)
The printer images constant text, line, box, and graphic fields, but does not print them.
2. Input data for each field, and send it with a batch header using the parameter \(\mathbf{U}\) (update) and a quantity of zero. When the printer receives the data, it immediately images the field, but does not print it.

Example \(\{\mathrm{B}, 1, \mathrm{U}, 0\}\)
1,"RODGER DIST CTR" | \}
\(\{B, 1, U, 0\) |
2,"8292" |
At this time, the printer is imaging all associated fields, including fields that copy from other fields.
3. Repeat step 2 for each field except the last one.
```

{B,1,U,0 |
3,"BROADWAY" | }
{B,1,U,0 |
4,"555 WEST OAK AVE." | }

```
4. For the last field, input data and send it with the quantity of labels you want printed. When the printer receives input for the last field, it immediately prints the labels.

Example \{B,1,U,10 |
5,"DAYTON, OHIO" | \}

\section*{Increasing Throughput}

Reducing the imaging time increases throughput. You can also increase the baud rate to increase the transmission time and increase throughput. Make sure the communication settings at the printer match those at the host.

\section*{General Format Tips and Hints}

The following tips and hints are helpful to keep in mind when designing MPCLII formats.

\section*{With Formats}

If you want to modify your format fields, check digit fields, and configuration commands, use the optional entry method. This method enables you to reset only the parameters you want to change. Commas act as placeholders for unchanged parameters. The optional entry method reduces file size and increases the speed at which files are sent to the printer.

\section*{With Packets}

Leave parameters blank that you do not need to change when sending online configuration packets.

You can group fields with similar parameters. For example,
\(T, 1,10, V, 250,50,1,1,1,1, B, C, 0,0\) |
T,2,15,, 75 |
T,3,r,100 |
The first text field sets all the parameters for that field. The second text field's number of characters and column location changes from what was defined in the first field. In the third text field, only the column location is changed. This method can be used on bar code and constant text fields as well.

Note: You should understand the basics of each field before using this method.

After you modify any fields or parameters with the optional entry method, resend the format, batch, or configuration packet to the printer.

\section*{With Bar Codes}

Be careful when rotating or placing a UPC/EAN bar code with human readable characters, because the bottom reference point is at the bottom of the bars, not at the bottom of the human readable characters.

\section*{With Fields}

Data that remains the same for each label should be in a constant text field. Data that varies for each label should be in a text field.

Check for trailing spaces in text or constant text fields if you receive a "field off tag" error. An easy way to see trailing spaces is to print the field in the reverse font.

Make sure if you magnify a field, it does not go off the label or cover another field. Magnifying a field increases the distance between the printed character and the edge of the cell.

\section*{SAMPLES}

This appendix contains sample formats. You can customize any of these formats to meet your needs.

The samples pictured are oriented as if you are looking down at the display, watching labels come out of the front of the printer, as shown below.

\(\{F, 25, A, R, E, 200,200\), "Fmt 25 " |
C, \(140,40,0,1,2,1, W, C, 0,0, " S A M P L E\) FORMAT", 1 ।
B, 1, 12, \(\mathrm{F}, 85,40,1,2,40,5, \mathrm{~L}, 0\) ।
\(\mathrm{T}, 2,18, \mathrm{~V}, 50,50,1,3,1,1, \mathrm{~B}, \mathrm{~L}, 0,0,1 \mid\}\)

\section*{Sample MaxiCode Packets}

MaxiCode is a two-dimensional bar code developed by UPS (United Parcel Service, Inc.). Data must be defined in a specific way for UPS. Refer to the Guide to Bar Coding with UPS or the AIM MaxiCode Specification for more details about data requirements.

The printer supports modes \(0,1,2\), and 3 . Contact us for information about additional MaxiCode modes.
\begin{tabular}{c|l}
\hline \hline Mode & \multicolumn{1}{|c}{ Description } \\
\hline \hline 0 & Obsolete \\
\hline 1 & Obsolete \\
\hline 2 & Structured Message \\
\hline 3 & Structured Message \\
\hline 4 & No Known Application \\
\hline 5 & No Known Application \\
\hline 6 & No Known Application
\end{tabular}

You can select which mode to use in the bar code field or allow the printer to auto-select the mode ( 0,2 , or 3 ) based on your data. See "Defining a Bar Code Field" for more information. MaxiCode automatically pads data with the "!" character.

Note: MaxiCode does not support the NULL character.
Modes 2 and 3 are defined by the way the postal code, class of service, and country code fields are arranged. (The postal code, class of service, and country code are required fields.) Begin with the message header, then the primary data ( 15 characters), followed by the secondary message (up to 78 characters). Or, begin with the primary data, then the message header, followed by the secondary data. If the postal code data characters are all numeric then the MaxiCode symbol is set to Mode 2. If the characters are alphanumeric, or only contain ASCII characters 65 to 90, then the MaxiCode symbol is set to Mode 3.

If you receive an error 612, check your MaxiCode data. You may have not correctly structured or left out one of the three required fields (postal code, class of service, and country code) or the " \(\sim 029\) " character.

\section*{Sample Data Matrix Packets}

Data Matrix (ECC-200) is a two-dimensional bar code which is made up of square modules arranged within a perimeter finder pattern. There are 24 square symbol sizes available ranging from 10 rows by 10 columns to 144 rows by 144 columns. There are six rectangular symbol sizes available ranging from 8 rows by 8 columns to 16 rows by 48 columns. The symbol size is data dependent. Data Matrix automatically pads data.

Make sure you do not overlay other fields when designing your Data Matrix symbol. Smart imaging is automatically disabled on formats with a Data Matrix bar code. You should also allow a 3 or 4 dot "quiet zone" (blank space around the bar code's perimeter) for scanning. See "Defining a Bar Code Field" for more information.

\section*{Sample Batch Data with Special Characters}
\begin{tabular}{c|l}
\hline \hline To use this character in the bar code & enter these characters in the batch data \\
\hline \hline null character & \(\sim \sim @\) \\
\hline\(\sim\) (tilde \()\) & \(\sim 126 \sim 126\) \\
\hline FNC1 & \(\sim \sim 1\)
\end{tabular}

\section*{Square Data Matrix Packet}
```

{F,36,A,R,E,400,400,"DTMTRX1" |
B,1,50,V,50,100,35,0,100,8,L,0 | }

```
\(\{B, 36, N, 1 \quad \mid\)
1,"1234567890ABCDEFGHIJKLMNOPQRST" | \}

This example prints a one-inch wide by one-inch tall (100) square Data Matrix symbol using the default density (0) without any field rotation (0).

Rectangular Data Matrix Packet
```

{F,36,A,R,E,400,400,"DTMTRX2" |
B,1,400,V,100,200,35,29,50,8,L,1 | }
{B,36,N,1 |
1,"1234567890ABCDEFGHIJKLMNOPQRST" | }

```

This example prints a one-inch by a half-inch tall (50) rectangular 16 rows by 36 columns (density 29) Data Matrix symbol rotated 90 (1).

\section*{Sample Data Matrix with Function 1}
\(\{\mathrm{F}, 36, \mathrm{~A}, \mathrm{R}, \mathrm{E}, 400,400\), "DTMTRX1" |
\(\mathrm{B}, 1,50, \mathrm{~V}, 10,50,35,0,50,8, \mathrm{~L}, 0\) ।
\(\{B, 36, N, 1\) |
1,"~~110012345678902" | \}
This example prints a 0.50 -inch wide by 0.50 -inch tall (50) square Data Matrix symbol using the default density (0) without any field rotation (0). FNC1 appears in the batch data as \(\sim \sim 1\).

\section*{Sample Quick Response Packets}

Quick Response (QR Code) is a two-dimensional bar code, which is made up of square modules arranged in an overall square pattern. A unique finder pattern is located at three corners of the symbol. Four levels of error correction are available, along with a wide range of symbol sizes.
- Model 1 is the original specification.
- Model 2 is an enhanced form that includes additional features.

The maximum number of characters depends on the type of characters entered for the batch data and differs for the two models of QR Code.
\begin{tabular}{c|c|c}
\hline \hline Data Type & Model1 & Model2 \\
\hline \hline Numeric data & 1167 & 2710 \\
\hline Alphanumeric data & 707 & 2710 \\
\hline 8-Bit data & 486 & 2710 \\
\hline Kanji data & 299 & 1817
\end{tabular}

QR Code can accommodate Japanese Kana and Kanji characters and has a variety of applications, including marking spark plugs, radiators, printed circuit boards, and test tubes. Refer to the AIM International Symbology Specification for more details about data requirements.

\section*{Entering Batch Data for QR Code}

QR Code requires certain parameters at the beginning of all batch data.
\begin{tabular}{ll} 
Syntax & "error_cor mask\# data_input, char" \\
error_cor & Level of error correction. Some damaged bar codes may still be scannable if the error correction is \\
high enough. Options: \\
\(\mathbf{H}\) & Ultra high reliability level
\end{tabular}

\section*{QR Code Packet}
```

{F,1,A,R,E,200,200,"QRCODE" |
B,1,200,V,50,50,36,0,100,2,B,0 ।
{B,1,N,1 |
1,"HM,NO123456789012345" | }

```

\section*{Structured Append Mode}

QR Code offers a mode called structured append（or concatenated）that allows you to collect data from multiple QR Code symbols and use that data elsewhere．For example，the components of a sub－assembly can have individual QR Codes and the QR Code for the entire assembly contains all the data from the individual codes．This mode also requires certain parameters at the beginning of all batch data．

Syntax＂mode＿id code\＃\＃of＿div parity，error＿cor mask\＃data＿input char＂
\begin{tabular}{ll} 
mode＿id & Mode identifier．Use D to indicate the structured append（or concatenated）mode． \\
code\＃ & \begin{tabular}{l} 
Code number of the individual symbol in the concatenated set．You must use a two－digit number in \\
decimal．
\end{tabular} \\
\＃of＿div & \begin{tabular}{l} 
Total number of symbols in this concatenated set．You must use a two－digit number in decimal．
\end{tabular} \\
parity & Parity byte．You must use a two－digit number in hexadecimal．There is no standard parity byte． \\
error＿cor & \begin{tabular}{l} 
Level of error correction．Some damaged bar codes may still be scannable if the error correction is \\
high enough．Options：
\end{tabular}
\end{tabular} high enough．Options：

H Ultra high reliability level
Q High reliability level
M Standard level
L High density level
Note：As you increase the error correction level，the maximum number of characters（in the field） decreases．
mask\＃Mask number．Undefined．Leave blank or use 0.
data＿input Type of data input．Options：
A Automatic
M Manual
char
Type of characters．Options：
A Alphanumeric
B Binary
K Kanji
N Numeric
Note：In binary mode，the number of characters must be represented by the 4－digit number in decimal．
```

Example 1,"D0205E9,Q0A," |
C,"B006qrcode," | \}

```

Defines the structured append mode（D）for QR Code．This is symbol（02）of a concatenated set containing（05）symbols．The parity byte is E9．The error correction level is \(\mathbf{Q}\) ，which provides a high reliability．Use \(\mathbf{0}\) for the mask number．The data input mode is Automatic．The type of characters are binary（B）and there will be six（06）data characters（qrcode）．

Structured Append QR Code Packet

\section*{Bitmap Font Information}

Our bitmap fonts are either monospaced (each character occupies the same amount of space) or proportional (each character is a different width). Use monospaced fonts for price fields and data you want to list in a column. With proportionally spaced fonts, you may be able to place more characters on a line. However, you may need to experiment with these fonts and adjust field measurements in your format. The bitmapped fonts (either monospaced or proportional) appear jagged when magnified.
The magnification range is 1-7.
Use the MONARCH® MPCLTM Toolbox (Soft Font Utility), available on our Web site, to convert a bitmap font to Hex or Run-Length encoding for the printer. Select the point size and characters to print. Bitmap fonts may image faster than a TrueType font, but you are limited to the point size and characters you downloaded.

\section*{Monospaced Font Magnification}

Monospaced characters occupy the same amount of space within a magnification. Use monospaced fonts for price fields and data you want to list in a column. Decide how wide and tall you want the characters to appear on the labels. The following two tables show the width and height of each of the monospaced fonts after magnification.

This table includes the default ( 3 dots for Standard, 1 dot for Reduced, 3 dots for Bold) spacing.
\begin{tabular}{|c|c|c|c|c|}
\hline & Width Mag. & Standard & Reduced & Bold \\
\hline & Units & \begin{tabular}{l}
Character \\
Width Sample
\end{tabular} & \begin{tabular}{l}
Character \\
Width Sample
\end{tabular} & \begin{tabular}{l}
Character \\
Width Sample
\end{tabular} \\
\hline 1 x & 1/100 in. \(1 / 10 \mathrm{~mm}\) Dots & \[
\begin{aligned}
& 8.37 \\
& 21.26 \\
& 17
\end{aligned}
\] & \[
\begin{aligned}
& 3.9 \\
& 9.9 \\
& 8
\end{aligned}
\] & \[
\begin{aligned}
& 13.3 \\
& 33.78 \\
& 27
\end{aligned}
\] \\
\hline 7 x & \begin{tabular}{l}
1/100 in. \\
1/10 mm \\
Dots
\end{tabular} & \[
\begin{aligned}
& 49.75 \\
& 126.37 \\
& 101
\end{aligned}
\] & \[
\begin{aligned}
& 24.63 \\
& 62.56 \\
& 50
\end{aligned}
\] & \[
\begin{aligned}
& 84.24 \\
& 214 \\
& 171
\end{aligned}
\] \\
\hline
\end{tabular}

To calculate other font widths, multiply the font dots ( 14 dots for Standard, 7 dots for Reduced, 24 dots for Bold) by the magnification and add the default spacing ( 3 dots for Standard, 1 dot for Reduced, 3 dots for Bold) between characters.

\section*{Example}

14 (Standard font dots) \(\times 5\) (magnification) \(=70+3\) (default spacing between characters). There are 73 dots in the Standard font at \(5 x\).
\begin{tabular}{|c|c|c|}
\multicolumn{1}{c|}{ Standard } & \multicolumn{1}{c|}{\(\mathbf{A}\)} & \(7 x\) \\
\hline \(1 / 100 \mathrm{in}\). & 10.8 & 75.9 \\
\hline \(1 / 10 \mathrm{~mm}\) & 27.4 & 192.8 \\
\hline dots & 22 & 154 \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline Reduced & 1 x & \multirow{2}{c|}{} \\
\hline \(1 / 100 \mathrm{in}\). & 6.9 & 48.28 \\
\hline \(1 / 10 \mathrm{~mm}\) & 17.5 & 122.6 \\
\hline dots & 14 & 98 \\
\hline
\end{tabular}
\begin{tabular}{|c|c|c|}
\hline & & \\
\hline Bold & A & A \\
\hline \(1 / 100 \mathrm{in}\). & 16.7 & \(7 x\) \\
\hline \(1 / 10 \mathrm{~mm}\) & 42.4 & 297.8 \\
\hline dots & 34 & 238 \\
\hline
\end{tabular}

\section*{Proportional Font Magnification}

Each character in a proportionally spaced font is a different height and width. You may be able to place more characters on a line using proportionally spaced fonts. You may want to experiment with these fonts and adjust field measurements in your format as needed. The bitmapped fonts (either monospaced or proportional) appear jagged when magnified.
The magnification range is \(1-7\).
The following tables provide height and width magnification of sample characters.

CG Triumvirate \({ }^{T M}\) Typeface Bold (8 pt.)
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline & Width Mag. & & Minimum & & Average & & Maximum \\
\hline 1x & \[
\begin{aligned}
& 1 / 100 \mathrm{in} . \\
& 1 / 10 \mathrm{~mm} \\
& \text { Dots }
\end{aligned}
\] & \[
\begin{aligned}
& 1.56 \\
& 3.97 \\
& 3
\end{aligned}
\] & 1 & \[
\begin{aligned}
& 5.73 \\
& 14.55 \\
& 11
\end{aligned}
\] & L & \[
\begin{aligned}
& \hline 10.94 \\
& 27.78 \\
& 21
\end{aligned}
\] & w \\
\hline 7 x & \[
\begin{aligned}
& 1 / 100 \mathrm{in} . \\
& 1 / 10 \mathrm{~mm} \\
& \text { Dots }
\end{aligned}
\] & \[
\begin{array}{|l}
6.9 \\
17.5 \\
14
\end{array}
\] & & \[
\begin{array}{|l}
20.7 \\
52.6 \\
42
\end{array}
\] &  & \[
\begin{aligned}
& 41.4 \\
& 105.2 \\
& 84
\end{aligned}
\] &  \\
\hline
\end{tabular}

To calculate other font widths, multiply the font dots (3 dots for Minimum, 13 dots for Average, 22 dots for Maximum) by the magnification.

\section*{Example}

13 (Average font dots) x 5 (magnification) \(=65\) dots in an average letter of the CG Triumvirate \({ }^{\mathrm{TM}}\) Typeface Bold at 5x.

\section*{CG Triumvirate \({ }^{\text {TM }}\) Typeface Bold (6.5 pt.) Font \#1000}

\section*{Scalable Font Information}

The scalable font is smooth at any point size. There are no jagged edges because the font is created from an equation every time it is used. The field width varies with each letter.

When you define formats using scalable fonts, remember to set the character rotation to \(\mathbf{0}\), because it is not supported. However, field rotation is supported for text or constant text fields using the scalable font. The scalable font does not print a slashed zero.

The height and width magnification are defined in point size.
72 points = one inch. One inch = cell size. The cell size is the built-in space around the individual characters of the scalable font. The point size range is \(\mathbf{4 - 2 5 0}\). If the height and width are not set to the same point size, the printed characters look tall and thin or short and thick, which allows for greater flexibility in the appearance of the font.

Scalable fonts perform better in constant text fields, because those fields are imaged only once per batch, not once per label as in text fields. The transparent overlay allows closer field placement when using scalable fonts.

The 72 point EFF Swiss Bold sample shows the one inch cell size.
```

6pt Sample
10pt Sample

```

\section*{24pt Sample}

\section*{48pt Sample}

\section*{72pt Sample}

\section*{TrueType Font Information}

TrueType fonts follow the TrueType outline font standard. These fonts are smooth at any point size. There are no jagged edges, because the font is created from an equation every time it is used. The height and width magnification are defined in point size. 72 points \(=\) one inch. One inch = cell size. The cell size is the built-in space around the individual characters of the scalable font. The point size range is 4-250. The field width varies with each letter. The printer can accept downloaded TrueType fonts.

\section*{Downloading TrueType Fonts}

The MONARCH® MPCL \({ }^{\text {TM }}\) Toolbox (Font Utility) is available on our Web site and converts TrueType fonts to Hex or Run-Length encoding for the printer.

When downloading a TrueType font, you download the entire font, not particular characters or one point size. You can print a variety of symbol sets with International (Turkish, Latin, Spanish, etc.) characters. TrueType fonts are designed to be regionally specific; therefore, all symbol sets may not be supported in a given font.

These font files are large and may image slower than bitmap fonts. The size of the font file, in bytes, is the minimum amount of memory you must have available for fonts in the printer's downloadable fonts buffer.

You may need to reallocate memory to use downloaded TrueType fonts. After reallocating memory, resend the font, format, and batch packets. See "Defining the Memory Configuration Packet" in Chapter 5 for more information. Also, Chapter 5 lists some special considerations when defining memory for downloaded TrueType fonts.

\section*{Using International Fonts}

International fonts are available as bitmap or TrueType fonts. See "Bitmap Font Information" or "TrueType Font Information" for more details. To use these fonts, you must purchase the print engine memory expansion option and download the font to the printer.

To use International fonts, consider the following information:
- All fonts contain an internal character mapping. The mapping is organized by one or more standards, such as BIG5. These mapping standards can provide over 65,000 characters, which are not represented in this manual.
The printer supports several mapping standards:
- Unicode (UCS-2)
- BIG5
- GB2312
- SJIS
- Specify a symbol set based on the characters to print and one that is compatible with the font's character mapping. For example, to print Japanese characters, select symbol set 932 (Japanese Shift JIS) and a font compatible with that symbol set. See "Selecting a Symbol Set" for more information.
- To enter batch data, use the method specified by the font's character mapping and a compatible symbol set.

\section*{Selecting a Symbol Set}

Specify a symbol set based on the characters to print and one that is compatible with the font's character mapping. The symbol set parameter identifies the character mapping used in the text field or constant text field, for example, Unicode, BIG5, etc. If no symbol set is selected, the default symbol set (Internal Symbol Set) is used.

The printer automatically translates some character mappings to others. For example, if you need a BIG5 font, it is possible to use Unicode text data. Use Unicode in the symbol set parameter to indicate the text mapping and select the BIG5 font needed in the font parameter (T8 or C5). The printer automatically translates the Unicode character values into BIG5 values before printing the character.

The following table lists the compatible mappings and symbol sets.
\begin{tabular}{l|l|l}
\hline \hline Font Character Mapping & Symbol Set Parameter (T15, C13, or A6) \\
\hline \begin{tabular}{lll} 
Batch Data*
\end{tabular} & \begin{tabular}{c} 
TrueType Font \\
Character Mapping
\end{tabular} & use in text or constant text fields \\
\hline \hline Unicode & BIG5 & \begin{tabular}{l} 
102 - Unicode \\
If you are unsure which character mapping to select, use \\
this symbol set, because the printer automatically \\
translates the character mappings.
\end{tabular} \\
\cline { 1 - 2 } Unicode & SJIS & \\
\hline Unicode & KSC5601 & \\
\hline Unicode & GB2312 & Unicode
\end{tabular}
* Characters in batch data must be entered based on their mapping (Unicode, BIG5, etc.).

Note: Symbol sets 102-107 require the print engine memory expansion option and a downloaded International TrueType font.

\section*{International Font Sample}
\｛F，3，A，R，E，150，200，＂SIMPLE＂｜
T，1，5，V，10，10，0，100，30，30，B，L，0，0，102｜\}
\(\{B, 3, \mathrm{U}, 1\)｜
1，＂～125～000～125～002～125～004～125～005＂｜\} Font Number
This example prints these four characters with Unicode batch data of \(\sim 125 \sim 000, \sim 125 \sim 002\) ， \(\sim 125 \sim 004\) and \(\sim 125 \sim 005\) ．
紀紂約紅

Refer to the Internet for a listing of the characters in each code page．Search on a particular code page，such as＂codepage 936 ＂to view the characters in that code page．

\section*{Licensing Your Fonts}

We provide you with tools to create and download TrueType fonts．However，it is your responsibility to purchase and license any fonts you download to your printer．Contact your font supplier for licensing information．Additional fonts that are compatible with the printer can be purchased from：

The Electronic Font Foundry
11 Silwood Road；Ascot；SL5 OPY；England
（0）1344 875201
www．eff．co．uk
Korean，Chinese，and Japanese fonts can be purchased from：
Dynalab Inc．
2055 Gateway Place；Suite 400；San Jose，CA 95110
408－490－4224
www．dynalab．com

\section*{Locating the Font Number in a Font Packet}

If you are creating font packets，the font number is the second parameter in the packet． Software is available to create the font data and packet．Call Technical Support for more information．

Use this number in T8 or in C5．See＂Defining Text Fields＂or＂Defining Constant Text Fields＂in Chapter 2 for more information．

Example \(\quad T, 1,10, V, 30,10,0,200,1,1, B, L, 0,0,0\) ।
C，50，30，0，200，1，1，B，L，0，0，＂MONARCH＂， 0

\section*{Font Number}

Defines a text and constant text field using the downloaded（\＃200）font．

B-18 Fonts

\section*{SYMBOL SETS/CODE PAGES}

This appendix contains a listing of the symbol sets, code pages, and extended character sets the printer supports.

Use the charts in this appendix to convert dot sequences from the image dot pattern to codes you can use in the fields. Use the Binary to Hex Conversion Chart to convert Binary dot sequences to Hexadecimal numbers for bitmap files. Use the Dot to Run Length Encoding Chart to convert dot sequences to alphabetic characters for bitmap files.

\section*{Supported Symbol Sets and Code Pages}

The printer supports these symbol sets and code pages: Internal, ANSI, Bold, OCRA Character Set, DOS Code Page 437 and 850. Additional Code Pages are supported with downloaded TrueType or Unicode (double-byte) fonts.

The printer defaults to the internal symbol set.
Note: Fonts 1004, 1005, 1010, and 1011 are limited to the following special characters: 0123456789\#\$\%\&(),./@DFKLMPSIkprö¢£¥. These fonts do not support the full ANSI character set and some characters above decimal value 127 are substituted.

\section*{Selecting a Symbol Set or Code Page}

The CG Triumvirate \({ }^{\text {TM }}\) typefaces support only the ANSI and DOS Code Page 437 and 850 Symbol Sets. These fonts print a slashed zero when using the ANSI symbol set.

> Internal Use this symbol set to print international monetary symbols, the trademark ( \({ }^{\mathrm{TM}}\) ) symbol, and for formats that may be used on other MPCLII printers.
\begin{tabular}{ll} 
ANSI & Use this symbol set with proportionally spaced fonts. \\
DOS Code & \begin{tabular}{l} 
Use this symbol set for extended and international characters \\
Pages \(\mathbf{4 3 7}\) or \(\mathbf{8 5 0}\) \\
with proportionally spaced fonts.
\end{tabular}
\end{tabular}

\section*{Using Code 128 Function Codes}

This table lists the characters for Bar Code 128 function codes. These functions are used with scanners.
\begin{tabular}{c|c}
\hline \hline Code & Function Code \\
\hline \hline\(\sim 201\) & F1 \\
\hline\(\sim 202\) & F2 \\
\hline\(\sim 203\) & F3 \\
\hline\(\sim 204\) & F4
\end{tabular}

\section*{Entering Extended Characters}

When using extended characters in your batch data file, type a tilde in front of the three-digit code. For example, if you want to include the character Á in a text field using the Internal Symbol Set, type:
1,"~142" |

\section*{Using International Character Sets/Code Pages}

Symbol sets 100, 101, 852-860, and 1250-1258 may only be used with the scalable font (font\#50) or downloaded TrueType fonts. TrueType fonts are designed to be regionally specific; therefore, all symbol sets may not be supported in a given font. For example, to print Hebrew characters, you need to find a font (such as Arial) that supports Hebrew characters; convert, and then download the font to your printer. Make sure the correct symbol set for Hebrew characters is selected.

Font 50 does not print the slashed zero or support Code Pages 101 (Wingdings) and 1256 (Arabic). The Euro symbol at position \(\sim 192\) is only available in the Standard, Reduced, and Bold fonts.

Code pages 102-107 contain thousands of characters, which are not represented in this manual. These code pages require the print engine memory expansion option and a downloaded International TrueType font.

The Code Pages (100 and greater) on the following pages were printed using Arial or a similar downloaded TrueType font. To determine the character code, add the column number and row number for the character. For example, to produce the \# character with the ANSI character set, you would press Alt 255 (column 15 + row 240).

\section*{Internal Symbol Set}

\section*{GLOSSARY}

Batch Data 2,"Monarch" |

Batch Control E,0,0,1,1 |

Batch Header
\{B,1,N,1|\}
Batch Packet
\{B,1,N,1 |
2,"Monarch" | \}
Bitmapped Fonts

Buffer

Field

Field Definition

Field Parameters

Flash Memory
Format
Format Header
\{F,1,A,R,E, 600,400,"Fmt-1" |
Monospaced Fonts All characters have the same width and are easy to center justify. (Standard, bold, and reduced are monospaced.)

Option
R,4,6,1,3,1 |
Packet
\{B,1,N,1 |
2,"Monarch" |\}
Pre-image

Layout or design for your printed label.
First line of a format, immediately following the start of packet (\{). A format header must begin with F, followed by various header elements.
Defines the actual information (as fields within \{ \}) printed on the label.

Defines the print job (as a field).

First line of a batch, immediately following (\{). Identifies the format and batch quantity.

Contains a batch header and the batch data. Enclosed within \{ \}.

Reside in the printer's memory. If you change the point size, you have changed the font. Magnifying these fonts causes some jaggedness to occur.

Storage area in the printer's memory that holds specific data (images, formats, etc).

Can be text, bar codes, lines, boxes, constant, or non-printable text. It is the result of a field definition.

Any string of parameters that pertain to one field. A field definition begins with a field identifier (such as T, B, D, C, etc.).

T,1,10,V,250,50,0,1,1,1,B,C,0 |
Parameters that apply to a field and are separated by commas. (In the above example, \(B\) is a field element for black print on a white background.)

Contains information that is SAVED when the printer is turned off.

Any line within a format that applies special formatting to a field. This line always begins with R and must immediately follow the field it applies to.

Any string of characters within (\{ \}).

A way to optimize the printer, because it images the fields while data is collected. After the last field is imaged, the label prints almost immediately.

Proportionally
Spaced Fonts
Scalable Fonts

All characters have different widths and are difficult to center justify (CG Triumvirate \({ }^{\text {TM }}\) Typefaces).

All characters are scalable and smooth at any point size. There are no jagged edges at any point size because the font is created from an equation every time it is used.

Soft (Downloaded) Reside in the printer's RAM. They can be erased or overwritten. Fonts

TrueType Fonts

Volatile RAM

All characters follow the TrueType outline font standard. All characters are scalable and smooth at any point size.

Contains information that is LOST when the printer is turned off.
